Release Notice

This is the June 2002 release (Revision A) of the Lassen™ SQ GPS Receiver System Designer Reference Manual, part number 47838-00.

The following limited warranties give you specific legal rights. You may have others, which vary from state/jurisdiction to state/jurisdiction.

Hardware Limited Warranty

Trimble warrants that this Trimble hardware product (the “Product”) shall be free from defects in materials and workmanship and will substantially conform to Trimble’s applicable published specifications for the Product for a period of one (1) year, starting from the date of delivery. The warranty set forth in this paragraph shall not apply to software/firmware products.

Software and Firmware License, Limited Warranty

This Trimble software and/or firmware product (the “Software”) is licensed and not sold. Its use is governed by the provisions of the applicable End User License Agreement (“EULA”), if any, included with the Software. In the absence of a separate EULA included with the Software providing different limited warranty terms, exclusions, and limitations, the following terms and conditions shall apply. Trimble warrants that this Trimble Software product will substantially conform to Trimble’s applicable published specifications for the Software for a period of ninety (90) days, starting from the date of delivery.

Warranty Remedies

Trimble’s sole liability and your exclusive remedy under the warranties set forth above shall be, at Trimble’s option, to repair or replace any Product or Software that fails to conform to such warranty (“Nonconforming Product”), or refund the purchase price paid by you for any such Nonconforming Product, upon your return of any Nonconforming Product to Trimble in accordance with Trimble’s standard return material authorization procedures.

Warranty Exclusions and Disclaimer

These warranties shall be applied only in the event and to the extent that: (i) the Products and Software are properly and correctly installed, configured, interfaced, maintained, stored, and operated in accordance with Trimble's relevant operator's manual and specifications, and; (ii) the Products and Software are not modified or misused. The preceding warranties shall not apply to, and Trimble shall not be responsible for defects or performance problems resulting from (i) the combination or utilization of the Product or Software with products, information, data, systems or devices not made, supplied or specified by Trimble; (ii) the operation of the Product or Software under any specification other than, or in addition to, Trimble's standard specifications for its products; (iii) the unauthorized modification or use of the Product or Software; (iv) damage caused by accident, lightning or other electrical discharge, fresh or salt water immersion or spray; or (v) normal wear and tear on consumable parts (e.g., batteries).

THE WARRANTIES ABOVE STATE TRIMBLE'S ENTIRE LIABILITY, AND YOUR EXCLUSIVE REMEDIES, RELATING TO PERFORMANCE OF THE PRODUCTS AND SOFTWARE. EXCEPT AS OTHERWISE EXPRESSLY PROVIDED HEREIN, THE PRODUCTS, SOFTWARE, AND ACCOMPANYING DOCUMENTATION AND MATERIALS ARE PROVIDED "AS-IS" AND WITHOUT EXPRESS OR IMPLIED WARRANTY OF ANY KIND BY EITHER TRIMBLE NAVIGATION LIMITED OR ANYONE WHO HAS BEEN INVOLVED IN ITS CREATION, PRODUCTION, INSTALLATION, OR DISTRIBUTION, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, TITLE, AND NONINFRINGEMENT. THE STATED EXPRESS WARRANTIES ARE IN LIEU OF ALL OBLIGATIONS OR LIABILITIES ON THE PART OF TRIMBLE ARISING OUT OF, OR IN CONNECTION WITH, ANY PRODUCTS OR SOFTWARE. SOME STATES AND JURISDICTIONS DO NOT ALLOW LIMITATIONS ON DURATION OR THE EXCLUSION OF AN IMPLIED WARRANTY, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

TRIMBLE NAVIGATION LIMITED IS NOT RESPONSIBLE FOR THE OPERATION OR FAILURE OF OPERATION OF GPS SATELLITES OR THE AVAILABILITY OF GPS SATELLITE SIGNALS.

Limitation of Liability

TRIMBLE'S ENTIRE LIABILITY UNDER ANY PROVISION HEREIN SHALL BE LIMITED TO THE GREATER OF THE AMOUNT PAID BY YOU FOR THE PRODUCT OR SOFTWARE LICENSE OR U.S.\$25.00. TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT SHALL TRIMBLE OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES WHATSOEVER UNDER ANY CIRCUMSTANCE OR LEGAL THEORY RELATING IN ANY WAY TO THE PRODUCTS, SOFTWARE, AND ACCOMPANYING DOCUMENTATION AND MATERIALS, (INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, OR ANY OTHER PECUNIARY LOSS), REGARDLESS OF WHETHER TRIMBLE HAS BEEN ADVISED OF THE POSSIBILITY OF ANY SUCH LOSS AND REGARDLESS OF THE COURSE OF DEALING WHICH DEVELOPS OR HAS DEVELOPED BETWEEN YOU AND TRIMBLE. BECAUSE SOME STATES AND JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

Glossary

About this Manual

Welcome to System Designer Reference Manual for the Lassen SQ GPS receiver. This manual describes how to integrate and operate the Lassen SQ GPS receiver.

If you are not familiar with GPS, visit Trimble's website, www.trimble.com, for an interactive look at Trimble and GPS.

Trimble assumes that you are familiar with Microsoft Windows and know how to use a mouse, select options from menus and dialogs, make selections from lists, and refer to online help.

Technical Assistance

If you have a problem and cannot find the information you need in the product documentation, contact the Trimble Technical Assistance Center at 800-767-4822.

Your Comments

Your feedback about the supporting documentation helps us to improve it with each revision. To forward your comments, send an e-mail to ReaderFeedback@trimble.com.

Product Overview

The Lassen SQ GPS receiver is a full featured, ultra low power receiver on a miniature form factor, suitable for a variety of mobile, embedded applications. The Lassen SQ GPS receiver incorporates Trimble's FirstGPS™ architecture in the form of two ASICs: Colossus RF down converter and IO-TS-C33 baseband chip. The IO-TS-C33 integrates Trimble's IO digital signal processor with the Epson C33 RISC processor, real-time clock, UART, and 1Mbit memory. Together with the colossus RF, this implementation of FirstGPS technology makes possible one of the smallest (26 mm x 26 mm x 6mm) and lowest power (100mW) GPS modules available.

The Lassen SQ GPS receiver outputs a complete position, velocity, and time (PVT) solution in the NMEA Version 3.0 ASCII protocol, and the Trimble TSIP binary protocol. A Pulse-Per-Second signal is available for very accurate timing applications.

Starter Kit

The Starter Kit makes it simple to evaluate the Lassen SQ GPS receiver's exceptional performance. The Starter Kit can be used as a platform for configuring the receiver module and as a platform for troubleshooting your design. The Starter Kit includes:

- Shielded Lassen SQ GPS module mounted on an interface motherboard in a durable metal enclosure. The motherboard accepts 9 - 32 VDC power and provides regulated +3.3V power to the Lassen SQ GPS receiver. The motherboard also contains:
 - 3.6V lithium battery that provides back-up power to the receiver.
 - Circuitry to convert the TTL output to RS-232, enabling the user to connect the RS-232 port in the Starter Kit to the PC COM port via an RS-232 cable connection.
- Compact Magnetic-Mount GPS Antenna with a 5 meter cable.
- Ultra-Compact Embedded Antenna with an 8 cm cable.
- 9-pin RS-232 interface cable.
- AC/DC power supply adapter (input: 100-240VAC, output: 12 VDC).
- DC power cable.
- Cigarette lighter adapter power cable.
- CD containing software tools used to communicate with the receiver, the System Designer Reference Manual, and "C" programming source routines to be used as a template for communicating with the receiver.

Removing the Lassen SQ GPS Module

The Lassen SQ GPS module is secured to the motherboard with double-sided adhesive tape allowing for easy removal and integration with the user's application. (The adhesive tape used by Trimble is 3M Scotch, part number 4945).

Follow these steps to remove the module from the motherboard:

- Unplug the I/O cable and the RF cable from the module.
- Use a small flat-head screw driver to pry the Lassen SQ GPS receiver module off the motherboard.

Warning – Once the Lassen SQ GPS receiver module is removed from the motherboard, the double-sided tape loses some of its adhesive quality. This adhesive tape may only be re-used for laboratory testing. The original adhesive tape should not be re-used for drive testing the Starter Kit interface unit because the module could loosen and cause short circuit when contacting other motherboard components. If drive testing is required, use a new piece of double-sided adhesive tape to re-attach the Lassen SQ GPS receiver module to the motherboard.

Receiver Performance

The Lassen SQ GPS receiver is a complete 8-channel parallel tracking GPS receiver designed to operate with the L1 frequency, Standard Position Service, Coarse Acquisition code. Using two highly integrated Trimble custom integrated circuits, the receiver is designed in a modular format especially suited for embedded applications where small size and extremely low power consumption are required. The receiver features Trimble's latest signal processing code, a high-gain RF section for compatibility with standard 27 dB active gain GPS antennas, and a CMOS TTL level pulse-per-second (PPS) output for timing applications or for use as a general purpose synchronization signal.

The Lassen SQ GPS receiver acquires a position fix with minimal delay after power cycling. The battery back-up RAM is used to keep the Real Time clock (RTC) alive, and to store the following:

- Almanac
- Ephemeris
- Last position

User settings such as port parameters and NMEA settings can be stored in the receiver's non-volatile (Flash) memory. These settings are retained without application of main power or battery back-up power.

The Lassen SQ GPS receiver has a single configurable serial I/O communication port.

Warning – When customizing port assignments or characteristics, confirm that your changes do not affect your ability to communicate with the receiver (see Chapter 3, Software Interface).

Interface Protocols

The Lassen SQ GPS receiver operates using one of two protocols — Trimble Standard Interface Protocol (TSIP) or NMEA 0183. The factory default setting for the I/O port is TSIP bi-directional. Protocol selection and port characteristics are user configurable.

TSIP

TSIP is a powerful binary packet protocol that allows the system designer maximum configuration control over the GPS receiver for optimum performance in any number of applications. TSIP supports over 20 commands and their associated response packets for use in configuring the Lassen SQ GPS receiver to meet user requirements.

NMEA

NMEA 0183 is an industry standard protocol common to marine applications. NMEA provides direct compatibility with other NMEA-capable devices such as chart plotters, radars, etc. The Lassen SQ GPS receiver supports most NMEA messages for GPS navigation. NMEA messages and output rates can be user selected as required.

Ordering Starter Kit Components

The Lassen SQ GPS receiver is available in a Starter Kit or as an individual module and associated antenna. The Starter Kit (PN 47225-00) includes all the components necessary to quickly test and integrate the module:

- Compact Magnetic-Mount Antenna with 5m cable
- Ultra-Compact Embedded Antenna with 8cm cable
- AC/DC power supply adapter
- DC Power cable (3-wire)
- RS-232 interface cable DB9M/DB9F (pin to pin)
- Cigarette lighter adapter power cable
- CD-ROM containing software tools and the System Designer Reference Manual

Table 1.1 provides ordering information for the Lassen SQ GPS module and the associated antennas and cables.

Table 1.1 Lassen SQ GPS Receiver Ordering Information

Products	Part Number
Lassen SQ GPS receiver Module	46240-00
Lassen SQ GPS receiver Starter Kit	47225-00
Lassen SQ GPS receiver antenna transition cable	47274
Ultra-Compact Embedded Antenna, 3.3V, 8cm cable	45336-00
Compact Unpackaged Antenna, 3V, 11cm cable	39265-51
Compact Magnetic Mount Antenna, 3V, 5m cable	39265-50

Note – Part numbers are subject to change. Confirm part numbers with your Trimble representative when placing your order.

Starter Kit Interface Unit

The Starter Kit interface unit consists of a Lassen SQ GPS module attached to an interface motherboard, housed in a sturdy metal enclosure. This packaging simplifies testing and evaluation of the module by providing an RS-232 serial interface which is compatible with most PC communication ports. Power (9-32 VDC) is supplied through the power connector on the front of the interface unit. The motherboard features a switching power supply which converts this voltage input to the 3.3 volts required by the module. The DB9 connector allows for an easy connection to a PC serial port using the serial interface cable provided in the Starter Kit. The metal enclosure protects the module and the motherboard for testing outside of the laboratory environment.

The Lassen SQ GPS receiver is a single module encased in a sturdy metal enclosure. The dimensions of the receiver in this enclosure are 26 mm H x 26 mm L x 6 mm H (1.02" W x 1.02" L x 0.24" H). A straight-in, panel-mount RF connector (J1) supports the GPS antenna connection. The center conductor of the coaxial connector also supplies +3.3 VDC for the Low Noise Amplifier of the active antenna. An 8-pin (2x4), 0.09 inch header (J2) supports the serial interface (CMOS TTL level), the pulse-per-second (PPS) signal (CMOS TTL level), and the input power (+3.3 VDC). Figure e1.1 illustrates the module in the metal enclosure.

Figure 1.1 Lassen SQ GPS receiver Module

The interface motherboard includes a 9 to 32 VDC switching power supply which provides regulated +3.3 VDC power to the receiver, and contains circuitry which provides an RS-232 interface to a computer. A 3.6V lithium backup battery enables quick hot starts. The TTL level PPS is brought directly out to Pin 9 of the Port 2 DB9 connector on the front of the interface unit.

The Starter Kit includes an AC/DC converter for powering the module from an AC wall socket. The metal enclosure (see Figure 1.2.) provides 2 DB9 interface port connectors, an antenna connector, and a power connector. Port 1 is for serial I/O.

The mounting plate is secured to the metal enclosure with four screws. The eight pin I/O header on the receiver module connects to a mating connector on a ribbon cable. The ribbon cable is attached to a mating I/O connector on the interface motherboard. Figure 1.2 illustrates the Starter Kit interface unit.

Figure 1.2 Starter Kit Interface Unit

Serial Port Interface

The Starter Kit interface unit is a DCE (Data Communication Equipment) device. To connect to a host computer, or DTE (Data Terminal Equipment) device, use a straight through cable. To connect a Differential Radio (DCE device) to the receiver (DCE Device) use a cross over cable or null modem cable.

9	PPS Out

Pulse-Per-Second (PPS)

The Lassen SQ GPS receiver provides a four microsecond wide, CMOS compatible TTL level Pulse-Per-Second (PPS). The PPS is a positive pulse available on pin 9 of the port 2 DB9 connector of the interface unit (see Table 1.3). The rising edge of the PPS pulse is synchronized with respect to UTC. The timing accuracy is ± 95 nanoseconds when valid position fixes are being reported.

The rising edge of the pulse is typically less than 20 nanoseconds. The distributed impedance of the attached signal line and input circuit can affect the pulse shape and rise time. The PPS can drive a load up to 5mA without damaging the module. The falling edge of the pulse should not be used. The PPS is always on (early PPS) and is driven by the Real Time Clock (RTC) until the receiver acquires GPS time from the satellite and generates position fixes. The PPS is output immediately after main power is applied, and continues even if the receiver loses GPS lock. The drift of the PPS, when the receiver is not tracking satellites, is unspecified and should not be used for synchronization.

***Note** – Trimble has measured better than 50 nanosecond accuracy on the Lassen SQ GPS receiver's PPS signal in static mode. For more information on use of the Lassen SQ GPS receiver in timing applications, contact your Trimble sales representative.*

Power

The Lassen SQ GPS receiver receiver is designed for embedded applications and requires a regulated +3.3 VDC input (+3.0 to +3.6 VDC). The receiver provided in the Starter Kit is installed on a motherboard, providing a DC power regulator which converts a 9 to 32 VDC input to the regulated 3.3 VDC required by the receiver. Power can be applied to the interface unit using one of three options: the DC power cable (Figure 1.3), the AC/DC power converter (Figure 1.4), or the cigarette lighter adapter.

Figure 1.3 DC Power Cable

The DC power cable is ideal for bench-top or automotive testing environments. The power cable is terminated at one end with a 3-pin plastic connector which mates with the power connector on the metal enclosure. The un-terminated end of the cable provides easy connection to a DC power supply. Connect the red power lead to a source of DC positive +9 to +32 VDC, and connect the black power lead to ground. This connection supplies power to both the receiver and the antenna. The combined power consumption of the interface unit with the receiver and the antenna is 133 - 145 milli-amps.

Note – *To ensure compliance with CE conducted emissions requirements when using the DC power cable, the Starter Kit interface unit must be bonded to a ground plane.*

Note – *The yellow wire of the DC power cable is not used. Battery back-up power is provided by a factory installed 3.6V lithium battery on the motherboard.*

The AC/DC power converter may be used as an alternate power source for the interface unit. The AC/DC power converter converts 110 or 220 VAC to a regulated 12 VDC compatible with the interface unit. The AC/DC power converter output cable is terminated with a 3-pin connector compatible with the power connector on the metal enclosure. The AC power cable is not provided in the kit, since this cable is country-specific. The input connector is a standard 3-prong connector used on many desktop PCs.

Figure 1.4 AC/DC Power Converter

Hardware Setup

The Lassen SQ GPS receiver supports the TSIP and NMEA protocols. A single port supports both the input/output of TSIP messages and the output of NMEA messages. Follow the steps below to setup the Starter Kit interface unit. Figure 1.5 illustrates the setup.

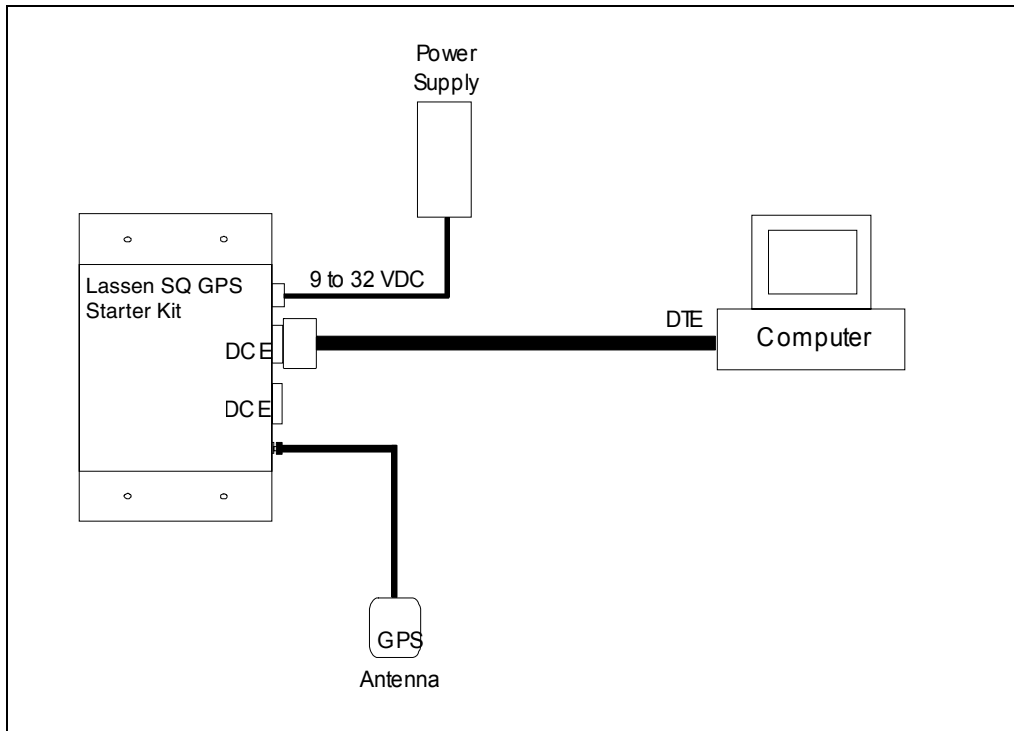

Figure 1.5 Starter Kit Interface Unit

1. When using the TSIP protocol, connect one end of the 9-pin serial interface cable to Port 1 of the interface unit. Connect the other end of the cable to COM1 or COM2 on a PC. A 9-pin-to-25-pin adapter may be required for the serial interface connection to a PC, if your PC has a 25-pin communication port.
2. Connect the antenna cable to the interface unit. This connection is made by pushing the antenna cable connector onto the MCX connector on the module. Place the antenna so that it has a clear view of the sky.

Note – To remove the antenna cable, grasp the antenna mating MCX connector and pull from the MCX connector mounted on the interface unit.

3. Using either the DC power cable or an AC/DC power converter, connect to the 3-pin power connector on the interface unit.
 - DC Power Cable — connect the terminated end of the power cable to the power connector on the interface unit. Connect the red lead to DC positive voltage (+9 to +32 VDC) and black power lead to DC ground. The yellow wire is not used. Switch on the DC power source.
 - AC/DC Power Converter — connect the output cable of the converter to the 3-pin power connector on the interface unit. Using the appropriate 3-prong AC power cable (not provided), connect the converter to an AC wall socket (110 VAC or 220 VAC). The AC power cable is not provided in the Starter Kit.

Software Toolkit

The CD provided in the Starter Kit contains the SQ_Monitor and the TSIPCHAT interface programs used to monitor GPS performance and to assist system integrators in developing a software interface for the GPS module. These applications are described in detail in Appendix B, *TSIP User's Guide*.

SQ_Monitor runs on the Windows 95/98/2000 platforms. TSIPCHAT runs under the DOS operating system on a 386 or higher processor.

Following are quick start instructions for using the SQ_Monitor application to monitor the receiver's performance.

1. Connect one end of the serial interface cable to Port 1 of the interface unit. Connect the other end of the cable to the COM port of your PC.
2. Turn on the DC power source or plug in the AC/DC converter.
3. Insert the CD in the computer's CD-ROM drive.
4. The SQ_Monitor program may be run directly off the CD or it may be copied onto your computer's hard drive. To run the program off the CD, initiate the SQ_Monitor.exe file.
5. When the SQ_Monitor screen appears, the TX and RX indicators appear in the lower left corner of the status bar. A blinking TX indicates that the PC is transmitting commands to the receiver; a blinking RX indicates that the PC is receiving reports from the receiver. If either of these indicators stop blinking, there is no activity. The PC COM port settings appear in the lower right corner of this same status bar.
6. After a GPS antenna is connected to the receiver and the receiver has achieved a position fix, the transmitted position reports, time, velocity, satellites tracked, and GPS receiver status appear on the screen. The receiver also sends a health report every few seconds, even if satellites are not being tracked.

***Note** – If the SQ_Monitor program displays a question mark (?) in a data field, the receiver has not reported a status for this field. If a (?) remains in the data field, the GPS module may not be communicating with the computer. Re-check the interface cable connections and verify the serial port selection and settings. If the communication failure continues after checking all connections and settings, please call the Trimble Technical Assistance Center (TAC) at 1 (800) 767-4822.*

Hardware Integration

In this chapter:

- General Description
- Connectors
- Power Requirements
- Serial Interface
- Pulse-Per-Second (PPS)
- Mounting
- GPS Antennas

General Description

Trimble's new Lassen SQ GPS receiver adds complete GPS functionality to mobile products, in a postage-stamp-sized footprint with ultra-low power consumption. Using Trimble's breakthrough FirstGPS™ architecture, the module delivers complete position, velocity and time (PVT) solutions for use in mobile, battery-powered applications such as cell phones, pagers, PDAs, and digital cameras.

The Lassen SQ GPS module is packaged in a tiny form factor (26 mm x 26 mm x 6 mm, including the metal shield). It typically requires only 100 mW of power (at 3.3 VDC). Total typical power usage, including the Trimble 3.3 VDC miniature antenna, is 133 mW. The module includes flash memory for field upgrades and for storing the user configuration.

Figure 2.1 Lassen SQ GPS Receiver Board without Shield

Connectors

Digital IO/Power Connector

The Lassen SQ GPS module uses a single 8-pin (2x4) male header connector for both power and data I/O. The power and I/O connector, J2, is a surface mount micro terminal strip. This connector uses 0.09 inch (2.286mm) high pins on 0.05 inch (1.27mm) spacing. The manufacturer of this connector is Samtec, part number ASP 69533-01.

Note – See Appendix D for mechanical drawings and specifications.

Mating Connectors

The customer must supply his own mating connector to the Lassen SQ GPS receiver 8-pin (2x4) connector. There are two mating connectors available:

- Surface-Mount Mating Connector

A recommended surface mount mating connector is Samtec's part number CLP-104-02.

When a surface-mount mating connector is chosen, the RF connector must be attached to the Lassen SQ GPS module prior to securing the module to the user's PCB. The mounting tabs may be used for securing the Lassen SQ GPS module to the PCB when using the surface-mount mating scheme.

- Cable Strip Mating Connector

A low profile, cable strip mating connector is the second I/O mating method. A recommended cable strip part is Samtec's part number FFSD-04-?-XX part. The user will need to substitute the following letters and numbers into the part number when ordering this part where the '?' and 'XX' symbols occur: for the '?' symbol substitute the letter S for single end or D for double end; for the 'XX' symbol substitute the overall length in inches, $\pm 1/8$ inch, with a 2 inch minimum. Since the signals are CMOS TTL level signals, Trimble does not recommend cable lengths of longer than six inches.

If the cable strip I/O connector scheme is used, the connector side of the Lassen SQ module will be facing up and the mounting tabs will be on the top of the module away from PCB. The RF connector is easily accessible, using this interfacing methodology.

Figure 2.2 Cable Strip Mating Connector

RF Connector

The RF connector mounted on the Lassen SQ module is a Hirose connector, part number H.FL-R-SMT (10) 50 Ohm. The mating RF connector is Hirose H.FL-LP-XXX where XXX depends on the cable type.

Figure 2.3 Lassen SQ GPS Module with Connectors

Possible cable manufactures include the following:

- 1.48 mm diameter (single shield) cable:
 - CO-6F/FH-SB manufactured by Hitachi Cable Ltd.
 - UL1979 manufactured by Junkosha Co., Ltd.
 - 0.8DS-PBE manufactured by Sumitomo Electric Industry Co., Ltd.
- 1.32 mm diameter cable (double shield):
 - A12B0733 manufactured by Junkosha Co., Ltd.
- 1.47 mm diameter cable (single shield):
 - CXN2571 manufactured by W.L. Gore & Associated, Inc.

Trimble offers three antennas for use with the Lassen SQ GPS receiver: The Ultra-Compact Embedded Antenna, which mates directly to the RF connector. The Compact Unpackaged Antenna and the Compact Magnetic-Mount Antenna, which mate through the optional RF transition cable to the module's RF connector. For more information on the antennas, see pag e30.

Digital IO/Power Connector Pinout

The digital IO/Power connector pinout information is listed in Table 2.1.

Table 2.1 J2 I/O Connector Signals

Pin number	Function	Description
1	TXD A	Serial Port A transmit, CMOS/TTL
2	GND	Ground, Power and Signal
3	RXD A	Serial Port A receive, CMOS/TTL
4	PPS	Pulse-Per-Second, CMOS/TTL
5	Reserve	No connect
6	Reserve	No connect
7	Prime Power (VCC)	+3.3 VDC to ± 0.3 VDC
8	Battery Backup Power	+2.5 VDC to + 3.6 VDC

Power Requirements

The Lassen SQ GPS module requires +3.3 VDC \pm 0.3 VDC at 33 mA, typical excluding the antenna. The on-board capacitance is 10 μ F. An important design consideration for power is the module's internal clock frequency at 12.504 MHz \pm 3 KHz. Interference spurs on prime power in this narrow frequency band should be kept to less than 1mV.

The receiver does not require any special power up or down sequencing. The receiver power is supplied through pin 7 of the I/O connector. See Table 2.2 for the +3.3 VDC power specifications.

Warning – The Lassen SQ GPS receiver is ready to accept TSIP commands approximately 2.1 seconds after power -up. If a command is sent to the receiver within this 2.1 second window, the receiver will ignore the command. The Lassen SQ GPS receiver will not respond to commands sent within the 2.1 second window and will discard any associated command data.

Battery Back-up

The Lassen SQ GPS receiver provides an input for battery back-up (BBU) power to keep the module's RAM memory alive and to power the real-time clock when the receiver's prime power is turned off. RAM memory is used to store the GPS almanac, ephemeris, and last position. User configuration data, including port parameters and receiver processing options can be stored in non-volatile Flash which does not require back-up power. By using battery back-up, time to first fix is reduced to 20 seconds (typical). Though not required, providing BBU power can reduce time to first fix. A 3.6 volt lithium battery used for back-up power can last up to five years.

Warning – If battery power is not present, the receiver’s power can be turned off and then back on to force a system reset and a cold start. The receiver should be off for no less than 3 minutes to ensure that the RAM memory does not retain any old data due to the residual voltage from the power supply. Alternatively, you can enter the cold start command (TSIP Packet 0x1E) to force a system reset and a cold start. Cycle power and issue the cold start TSIP command immediately after switching the power back on.

Note – 2.5V is the minimum allowable battery back-up voltage. When the battery back-up power output drops below 2.5V, the real-time clock may not operate over the specified temperature range. This can also significantly extend the time to first fix.

Table 2.2 Power Requirements

Signal	Voltage	Current	J2 Pin #
VCC	3.0 to 3.6	33mA	7
Battery Back-up	2.5 to 3.6	19 μ A (at 3.3 volts, +25°C)	8
Ground	0	--	2

Serial Interface

As an embedded design, the Lassen SQ GPS module provides direct CMOS compatible TTL level serial I/O. The RX and TX signals on the J2 I/O connector are driven directly by the UART on the Lassen SQ GPS receiver. Interfacing these signals directly to a UART in your application circuitry provides direct serial communication without the complication of RS-232 or RS-422 line drivers.

***Note** – The serial I/O signals on J2 are TTL level. They are not inverted or driven to RS-232 levels.*

Pulse-Per-Second (PPS)

The Lassen SQ GPS receiver provides a four microsecond wide, CMOS compatible TTL level Pulse-Per-Second (PPS). The PPS is a positive pulse available on pin 4 of the power and I/O connector. The rising edge of the PPS pulse is synchronized with respect to UTC. The timing accuracy is ± 95 nanoseconds when valid position fixes are being reported.

The rising edge of the pulse is typically less than 20 nanoseconds. The distributed impedance of the attached signal line and input circuit can affect the pulse shape and rise time. The PPS can drive a load up to 5mA without damaging the module. The falling edge of the pulse should not be used. The PPS is always on (early PPS) and is driven by the Real Time Clock (RTC) until the receiver acquires GPS time from the satellite and is getting fixes. The PPS is output immediately after main power is applied, and continues even if the receiver loses GPS lock. The drift of the PPS, when the Lassen SQ GPS receiver is not tracking satellites, is unspecified and should not be used for synchronization.

***Note** – Trimble Navigation has measured better than 50 nanoseconds accuracy on the Lassen SQ GPS receiver PPS signal in static mode. For more information on the use of the Lassen SQ GPS module in timing applications, contact your Trimble sales representative.*

Mounting

The Lassen SQ GPS PCB is encased in a metal enclosure. The enclosure acts as a protective case. There are four mounting solder tabs on the bottom of the enclosure. When the surface-mount mating connector is used, the mounting tabs may be used for securing the Lassen SQ GPS module on the user's PCB. When the cable strip I/O connector scheme is used, the connector side of the Lassen SQ GPS module will be faced up and the mounting tabs will be on the top of the module away from PCB.

The Lassen SQ GPS module can be attached to the integrator platform by many methodologies including solder, glue, double sided adhesive tape, and custom hold down mounts for the module's mounting tabs.

***Note** – See Appendix D for mechanical drawings and specifications regarding the spacing of the mounting tabs and the dimensions of the enclosure.*

GPS Antennas

The antenna receives the GPS satellite signals and passes them to the receiver. The GPS signals are spread spectrum signals in the 1575 MHz range and do not penetrate conductive or opaque surfaces. Therefore, the antenna must be located outdoors with a clear view of the sky. The Lassen SQ GPS receiver requires an *active* antenna. The received GPS signals are very low power, approximately -130 dBm, at the surface of the earth. Trimble's active antennas include a preamplifier that filters and amplifies the GPS signals before delivery to the receiver.

Trimble offers three antennas for use with the Lassen SQ GPS receiver described below and in Appendix D.

1. The Ultra-Compact Embedded GPS Antenna with an HFL connector, is ideal for portable and mobile applications. This unpackaged antenna is approximately the same size as the module itself, and can be easily integrated into mobile applications. This antenna is supplied with the Starter Kit (see Figure 2.4).
2. A Compact Unpackaged Antenna with an MCX connector, slightly larger than the ultra-compact model (see #1 above), mates to the Hirose connector on the Lassen SQ GPS module with an optional RF transition cable (see Figure 2.5).
3. A Compact Magnetic-Mount GPS Antenna with a 5 m cable and an MCX connector. This antenna provides for a flexible, movable installation. The MCX output connector mates to the Hirose connector on the Lassen SQ GPS module with an optional RF transition cable. This antenna is supplied with the Starter Kit (see Figure 2.6). The MCX connector on the end of the antenna cable mates to the MCX connector in the front of the Starter Kit interface unit.

Warning – When magnetic-mount or permanent-mount GPS antennas are installed on a metal surface for prolonged periods, care must be taken to insulate the antennas in order to prevent galvanic corrosion.

Software Interface

In this chapter:

- Start-up
- Communicating with the Lassen SQ GPS receiver Module
- Port Protocol and Data Output Options
- Custom Port Configuration
- When prompted, select the factory default option.

Start-up

Lassen SQ GPS module is a complete 8-channel parallel tracking GPS receiver designed to operate with the L1 frequency, standard position service, Coarse Acquisition code. When connected to an external GPS antenna, the receiver contains all the circuitry necessary to automatically acquire GPS satellite signals, track up to 8 GPS satellites, and compute location, speed, heading, and time. The receiver will automatically begin to search for and track GPS satellite signals at power-up.

The performance of a GPS receiver at power-on is determined largely by the availability and accuracy of the satellite ephemeris data and the availability of a GPS system almanac.

The first time the receiver is powered-up, it is searching for satellites from a cold start (no almanac). While the receiver will begin to compute position solutions within the first two minutes, the receiver must continuously track satellites for approximately 15 minutes to download a complete almanac. This initialization process should not be interrupted. With a complete almanac and back-up power, the time to first fix can typically be shortened to less than 45 seconds. The receiver will respond to commands almost immediately after power-up (see Warning below).

Note – See Chapter 4 for further detail on ephemeris data and the GPS almanac.

Warning – The Lassen SQ GPS receiver is ready to accept TSIP commands approximately 2.1 seconds after power -up. If a command is sent to the receiver within this 2.1 second window, the receiver will ignore the command. The Lassen SQ GPS receiver will not respond to commands sent within the 2.1 second window and will discard any associated command data.

Communicating with the Lassen SQ GPS receiver Module

The Lassen SQ GPS receiver supports two message protocols: TSIP and NMEA. Communication with the module is through a CMOS compatible, TTL level serial port. The port characteristics can be modified to accommodate your application requirements. Port parameters are stored in non-volatile memory (flash) which does not require backup power. Table 3.1. lists the default port characteristics.

Software Tools

The Software Tools provided on the Starter Kit CD-ROM include both user friendly Windows and DOS applications to facilitate communication with the receiver, via the Trimble Standard Interface Protocol (TSIP). This CD also includes sample C source code and reusable routines to aid in developing applications.

Note – The TSIP and NMEA protocols are discussed beginning on page 37 of this chapter, and in Appendix A, Appendix B, and Appendix C.

Port Configuration

The Lassen SQ GPS module has a single I/O port. Table 3.1 provides the default protocol and port configuration for the receiver, as delivered from the factory. TSIP IN/OUT is the default protocol.

Table 3.1 Default Protocol and Port Configuration

Input		Output	
Protocol	Default Setup	Protocol	Default Setup
TSIP	Baud Rate: 9600 Data Bits: 8 Parity: Odd Stop Bits: 1 No Flow Control	TSIP	Baud Rate: 9600 Data Bits: 8 Parity: Odd Stop Bits: 1 No Flow Control

The Lassen SQ GPS receiver can also be configured to output NMEA messages. The industry standard port characteristics for NMEA are:

- Baud Rate: 4800
- Data Bits: 8
- Parity: None
- Stop Bits:1
- No Flow Control

Any standard serial communications program, such as Windows Hyper-Terminal or PROCOMM, can be used to view the NMEA output messages. TSIP is a binary protocol and outputs raw binary serial data that cannot be read when using Windows Terminal or PROCOMM. To view the output of the TSIP protocol in text format, use the TSIPCHAT or the SQ_Monitor program (see the CD-ROM provided in the Starter Kit).

The serial port driver in the TSIPCHAT Tool Kit matches the Lassen SQ GPS receiver serial port characteristics. The TSIPPRNT program converts binary data logged with the TSIPCHAT program into text that may be printed and displayed. Both of these tools are included in the Software Developer's Toolkit.

Warning – When using the TSIP protocol to change port assignments or settings, confirm that your changes do not affect the ability to communicate with the receiver (e.g., selecting the PC COM port settings that do not match the receiver's, or changing the output protocol to TSIP while not using TSIPCHAT).

Port Protocol and Data Output Options

Protocol Configuration and Interface

The factory default protocol for the Lassen SQ GPS receiver is the Trimble Standard Interface Protocol (TSIP), for both input and output. The serial port setting is 9600 baud 8-odd-1. The receiver protocol can be re-configured using TSIP command packet 0xBC, in conjunction with TSIPCHAT, SQ_Monitor, or a user written serial interface program. See Table 2 for protocol configuration options, and Appendix A for details on the 0xBC command packet.

TSIPCHAT provides the simplest means to communicate with the receiver using a PC (386 or higher) running either the DOS or Windows operating systems. Responses are displayed on the computer monitor in text format.

SQ_Monitor, a Windows-based GUI, provides a versatile graphical interface for monitoring TSIP data. This application allows the user to view complete receiver operations including data output, status and configuration. In this application, the entry of command packets is replaced by traditional point and click pull-down menus.

C source code routines for TSIPCHAT are also provided on the CD contained in the Starter Kit. When used as software design templates, this source code can significantly speed-up code development.

The protocol settings and options are stored in battery-backed Random-Access-Memory (BBRAM). They can also be saved into the non-volatile memory (Flash), if desired, using command 0x8E-26. See to Appendix A for additional information on Flash storage for custom operation.

TSIP Data Output Modes

TSIP is the default protocol for the Lassen SQ GPS receiver. This binary language offers users a wide variety of commands and reports. TSIP enables the Lassen SQ GPS receiver to operate in two data output modes, both available during operation. In Query Mode, packet data is returned in response to input query packets. In Automatic Mode, a selected group of data packets is output continuously at two fixed rates – every second and every five seconds. The format and ensemble of the automatic output packets is configured using packets 0x35, 0x70, and 0x8E-20 (see Appendix xA for packet details). Packet settings are stored in BBRAM. They can also be saved in non-volatile memory (Flash) using command packet 0x8E-26. See Appendix A for additional information on Flash storage for custom operation.

Automatic TSIP Output Options and Defaults

Default 0x35 setting (byte 0, 1, 2, 3 = 2, 2, 0, 0):

- Position and velocity data precision: 4 byte floating point
- Position output option and format (byte 0 setting):
 - Latitude – radian
 - Longitude – radian
 - Altitude – meters (WGS-84)
- No super-packet output (byte 0 setting)
- Velocity output option and format (byte 1 setting):
 - East Velocity – meters/sec.; + for East
 - North Velocity – meters/sec.; + for North
 - Up Velocity – meters/sec.; + for Up

- Time reports option and format (byte 2 setting):
 - GPS (not UTC) time of week – seconds; 4 byte floating point
 - Extended GPS week number – weeks; 2 byte integer (INT16)
 - GPS UTC offset – seconds; 4 byte floating point

Default 0x70 setting (byte 0, 1, 2, 3 = 1, 1, 1, 0):

- Position-Velocity Dynamic Filter enabled
- Position-Velocity static Filter enabled
- Altitude Filter enabled

Default 0x8E-20 setting (byte 1 = 1):

- 0x8F-20 output is included in the super-packet for automatic output IF packet 0x35 selects the super-packet for automatic output options

Automatic TSIP Output Packets (fixed rate)

One second interval:

- 0x4A – (1) GPS position fix; (2) clock bias and time of fix; {20 byte format}
- 0x56 – velocity fix
- 0x6D – (1) list of satellites used for position fixes; (2) PDOP, HDOP, VDOP; (3) fix mode
- 0x82 – DGPS position fix mode

Five second interval:

- 0x41 – (1) GPS time of the week (seconds); (2) extended GSP week number; (3) GPS UTC offset(seconds)
- 0x46 – health of receiver
- 0x4B – (1) Machine/Code ID; (2) Real-time-clock availability status; (3) almanac validity status; (4) having super-packet support status

Packet Output Order

After power up or a software reset (packet 0x1E), seven start-up packets are sent, only once, by the receiver in this order: 45, 46, 4B, 4A, 56, 41, 82

Before position fixes are available, the 1 second and 5 second interval packets are sent in this order, periodically:

- Every one second for 5 seconds: 6D, 82
- Every five seconds 41, 46, 4B

When position fixes are available, the 1 second and 5 second interval packets are sent in this order, periodically:

- Every one second for 4 seconds: 4A, 56, 6D, 82
- Every 5 seconds: 4A, 56, 41, 46, 4B, 6D, 82

NMEA 0183 Protocol and Data Output Options

The National Marine Electronics Association (NMEA) protocol is an industry standard data protocol which was developed for the marine industry. Trimble has chosen to adhere stringently to the NMEA 0183 data specification as published by the NMEA. The Lassen SQ GPS receiver also adheres to the NMEA 0183, Version 3.0 specification.

NMEA data is output in standard ASCII sentence formats. Message identifiers are used to signify what data is contained in each sentence. Data fields are separated by commas within the NMEA sentence. In the Lassen SQ GPS receiver, NMEA is an output only protocol. The NMEA protocol is described in detail in Appendix C.

The receiver is shipped from the factory with the TSIP protocol configured on Port 1. The receiver can be reconfigured using TSIP command packet 0xBC, in conjunction with TSIPCHAT, SQ_Monitor, or a user written serial interface program.

The NMEA output messages selection and message output rate can be set using TSIP command packet 0x7A. The default setting is to output the GGA and VTG messages at a 1 second interval, when the receiver output protocol is configured to NMEA, using packet 0xBC.

If NMEA is to be permanent for the application, the protocol configuration (0xBC) and NMEA message output setting (0x7A) can be stored in the non-volatile memory (on-board flash) using TSIP command 0x8E-26.

Custom Port Configuration

TSIPCHAT can be used to customize the Lassen SQ GPS receiver configuration settings and to save a configuration to non-volatile memory. The most recent port configuration is stored in BBRAM. This eliminates the need to repeat setup each time the receiver power is cycled. However, if the battery-backed power is accidentally lost, the port configuration automatically resets to either what was saved in the non-volatile memory (Flash) or to the factory default.

Tip – To ensure continuous operation, store all port configuration changes in the non-volatile memory.

Following are step-by-step instructions for using TSIPCHAT to customize Lassen SQ GPS receiver port configuration.

Customizing the Configuration

1. Insert the CD in the CD-ROM drive of your computer.
2. Open a DOS window and set the path to the TSIPCHAT location.
3. To run the program, type TSIPCHAT -c1 if attached to PC COM1, or type TSIPCHAT -c2 if attached to PC COM2.
4. Power-up the receiver. Automatic report streams should be scrolling up in the DOS window. Assuming that your receiver is set to the default configuration, the settings will be: 9600 baud, 8-odd-1.

Note – If data is not being output after receiver power up, use the “^i” command in TSIPCHAT to reset the COM1/COM2 setting in PC (not the receiver).

Tip – Entering “?” in the TSIPCHAT window displays all the available commands and their corresponding TSIP packets.

5. To re-configure the port settings and protocol, type “U” and respond to the input prompts. At the end of this procedure, select the option that resets the PC COM port to match the new settings. Communication should resume almost immediately.

Saving the Configuration

1. Before storing the new configuration in Flash, confirm that the receiver has been configured to the desired settings.

Warning – Record the new serial port settings. If power is lost, this will speed-up recovery. Alternatively, the receiver can always be returned to the default configuration.

2. To save the configuration to Flash:
 - Enter “=” to access the command list page for the 0x8E command packet.
 - Enter “s”, to send the 0x8E-26 command packet.
 - Communication is momentarily suspended while the configuration is being stored in Flash.
3. To confirm that the configuration changes have been saved, turn-off the power supply and the battery back-up for a few minutes. Then, power-up the receiver and confirm that the configuration changes have been retained. Alternatively, you can use Packet 1E to command a cold start.

Note – Command packet 0x8E-26 executes storage of various types of receiver settings in addition to the port and protocol. See Table 3.2 for a complete list of the settings that can be stored in Flash memory.

Returning to the Factory Settings

At any time, the receiver can be returned to the factory default configuration, using command packet 0x1E.

1. Type “^k” to invoke the 0x1E command.
2. When prompted, select the factory default option.

**Table 3.2 TSIPChat Command Settings Stored in Flash Memory
Command Packet 0x8E-26**

TSIP Command ID	TSIPCHAT Keystroke	Description	TSIP Response ID
0x35	'O'	TSIP input/output formatting <ul style="list-style-type: none"> – Superpacket output (on/off) – Position format (LLA and/or ECEF) – Precision (double or single) – altitude format (MSL or HAE) – Timetag format (GPS or UTC) – SNR format (AMU or C/N₀) – Automatic pseudorange output 	0x55
0x70	'l'	Position filter controls <ul style="list-style-type: none"> – Position filter on/off – Static filter on/off – Altitude filter on/off 	0x70
0x7A	'q'	NMEA message formats and schedule <ul style="list-style-type: none"> – NMEA output messages – NMEA output interval 	0x7B

0x8E-20	'= g'	Fixed point superfix control (default = on)	0x8F-20

Timing Applications

The Lassen SQ GPS receiver is an excellent source for accurate system timing. Two examples of applications requiring accurate time are environmental data acquisition and synchronization of communications networks. The timing functions of the receiver are supported by the TSIP protocol and the PPS signal. See Report Packet 41 in Appendix A for a description of the time function reports for TSIP.

Note – GPS time differs from UTC (Universal Coordinated Time) by a variable integer number of seconds: $UTC = (GPS\ time) - (GPS\ UTC\ Offset)$

As of April 2002, the GPS UTC offset was 13 seconds. The offset increases by 1 second approximately every 18 months. System designers should plan to read the offset value as a part of the timing interface to obtain UTC. The GPS week number is in reference to a base week (Week #0), starting January 6, 1980.

The current GPS UTC offset is contained within the almanac transmitted by the GPS system. The Lassen SQ GPS receiver must have a complete almanac before the offset data is valid.

Extended GPS Week Number

The Lassen SQ GPS receiver outputs the Extended GPS Week Number as the absolute number of weeks since the beginning of GPS time or January 6, 1980. If the true GPS Week Number is desired, ignore the extra MSBs of the Extended GPS Week Number and use only the 10 LSBs (bytes 4 and 5 of Packet 0x41).

Operation and Performance

In this chapter:

- Introduction
- GPS Satellite Message
- Satellite Acquisition and Time to First Fix
- Satellite Mask Settings
- Standard Operating Modes
- Position Accuracy
- Coordinate Systems
- Performance Characteristics
- GPS Timing
- System Architecture

Introduction

This chapter describes the Lassen SQ GPS receiver satellite acquisition and tracking processes, performance characteristics, and system architecture. This discussion assumes that you are familiar with the basic theory of the Global Positioning System. Before proceeding to the detailed discussion of the satellite acquisition and tracking process, please review the GPS satellite message description on the next page.

The Lassen SQ GPS receiver satellite acquisition and tracking algorithms can achieve a position solution without any initialization. The receiver automatically selects and tracks the best combination of satellites to compute position and velocity. As satellites move out of view, the Lassen SQ GPS receiver automatically acquires new satellites and includes them in the solution set as required.

GPS Satellite Message

Every GPS satellite transmits the Coarse/Acquisition (C/A) code and satellite data modulated onto the L1 carrier frequency (1575.42 MHz). The satellite data transmitted by each satellite includes a satellite almanac for the entire GPS system, its own satellite ephemeris and its own clock correction.

The satellite data is transmitted in 30-second frames. Each frame contains the clock correction and ephemeris for that specific satellite, and two pages of the 50-page GPS system almanac. The almanac is repeated every 12.5 minutes. The ephemeris is repeated every 30 seconds.

The system almanac contains information about each of the satellites in the constellation, ionospheric data, and special system messages. The GPS system almanac is updated weekly and is typically valid for months. The ephemeris contains detailed orbital information for a specific satellite. Ephemeris data changes hourly, but is valid for up to four hours. The GPS control segment updates the system almanac weekly and the ephemeris hourly through three ground-based control stations. During normal operation, the Lassen SQ GPS receiver module updates its ephemeris and almanac as needed.

The performance of a GPS receiver at power-on is determined largely by the availability and accuracy of the satellite ephemeris data and the availability of a GPS system almanac.

Satellite Acquisition and Time to First Fix

Cold-Start

The term “cold-start” describes the performance of a GPS receiver at power-on when no navigation data is available. “cold” signifies that the receiver does not have a current almanac, satellite ephemeris, initial position, or time. The cold-start search algorithm applies to a Lassen SQ GPS receiver which has no memory of its previous session (i.e., is powered on without the memory backup circuit connected to a source of DC power). This is the “out of the box” condition of the GPS module as received from the factory.

In a cold-start condition the receiver automatically selects a set of eight satellites and dedicates an individual tracking channel to each satellite, to search the Doppler range frequency for each satellite in the set. If none of the eight selected satellites is acquired after a pre-determined period of time (time-out), the receiver will select a new search set of eight satellites and will repeat the process, until the first satellite is acquired. As satellites are acquired, the receiver automatically collects ephemeris and almanac data. The Lassen SQ GPS receiver uses the knowledge gained from acquiring a specific satellite to eliminate other satellites, those below the horizon, from the search set. This strategy speeds the acquisition of additional satellites required to achieve the first position fix.

The cold-start search sets are established to ensure that at least three satellites are acquired within the first two time-out periods. As soon as three satellites are found, the receiver will compute an initial position fix. The typical time to first fix is less than 2 minutes.

A complete system almanac is not required to achieve a first position fix. However, the availability and accuracy of the satellite ephemeris data and the availability of a GPS almanac can substantially shorten the time to first fix.

Warm Start

In a warm-start condition the receiver has been powered down for at least one hour but has stored a current almanac, an initial position, and time, in memory.

When connected to an external back-up power source (battery back-up), the Lassen SQ GPS receiver retains the almanac, approximate position, and time to aid in satellite acquisition and reduce the time to first fix. When an external back-up battery is not used, the TSIP protocol allows the almanac, an initial position, and time to be uploaded to the receiver via the serial port, to initiate a warm start.

During a warm start, the Lassen SQ GPS receiver identifies the satellites which are expected to be in view, given the system almanac, the initial position and the approximate time. The receiver calculates the elevation and expected Doppler shift for each satellite in this expected set and directs the eight tracking channels in a parallel search for these satellites.

The warm start time to first fix, when the receiver has been powered down for more than 60 minutes (i.e. the ephemeris data is old), is usually less than 45 seconds.

Hot Start

A hot start strategy applies when the Lassen SQ GPS receiver has been powered down for less than 60 minutes, and the almanac, position, ephemeris, and time are valid. The hot start search strategy is similar to a warm start, but since the ephemeris data in memory is considered current and valid, the acquisition time is typically less than 20 seconds.

Garage Search Strategy

During a warm start search, the Lassen SQ GPS receiver knows which satellites to search for, based on the system almanac, the initial position (last known position) and the current time. In some cases, the receiver may not be able to acquire the expected satellite signals (e.g., a vehicle parked in a garage or a vessel in a covered berth). Trimble's patented "garage search" strategy, also known as a split search, is designed for such situations.

If the receiver does not acquire the expected set of satellites within 5 minutes of power-on, some of the eight tracking channels will continue to search for the expected satellites (warm search) while the remaining channels are directed in a cold start search. This strategy minimizes the time to first fix in cases where the stored almanac, position and time are invalid. The stored information is flushed from memory, if the cold start search proves effective and the warm search fails.

System Reset

The Lassen SQ GPS receiver can be reset with software commands or by cycling power. A system reset will cause the receiver to restart and begin the satellite acquisition and tracking process again. There are three types of system resets: soft reset, hard reset, and factory reset. The TSIP protocol supports all three resets using the 0x1E command. Power cycling can be used for either the soft reset or the hard reset.

A soft reset is a system restart. In a soft reset, the system will attempt to acquire satellites using the satellite information and last position data stored in RAM, and the time information supplied by the real-time clock. There are two ways to initiate a soft reset:

- Cycling main power while keeping the memory and the real-time clock alive with back-up power.
- Issuing Command Packet 0x25.

A soft reset is the same as a warm or hot start, if the information contained in memory and supplied by the real-time clock is valid.

A hard reset is a system restart that results in satellite acquisition search using a default search set. Any data contained within RAM memory is discarded and the real-time clock is re-initialized. Even if back-up power is supplied, the information from memory and the real-time clock is not used. There are two ways to initiate a soft reset:

- Issuing the 0x1E command with a value of 0x4B.
- Cycling power without back-up power applied. Using this method, power must be removed for at least 3 minutes to ensure any residual memory storage is erased. If power is cycled rapidly, the 0x1E command with a value of 0x4B must then be issued to the receiver 2.5 seconds after power is restored to ensure a hard reset.

A factory reset is used to restore all the factory default settings into the receiver. Any user settings stored in Flash memory will be erased. Issuing the 0x1E command with a value of 0x46 will initiate a factory reset.

Satellite Mask Settings

Once the Lassen SQ GPS receiver has acquired and locked onto a set of satellites, which pass the mask criteria listed in this section, and has obtained a valid ephemeris for each satellite, it will output regular position, velocity and time reports according to the protocol selected.

The default satellite masks observed by the Lassen SQ GPS receiver are listed in Table 1. These masks serve as the screening criteria for satellites used in fix computations and ensure that position solutions meet a minimum level of accuracy. The Lassen SQ GPS receiver will only output position, course, speed and time when a satellite set can be acquired which meets all of the mask criteria. The satellite masks can be adjusted in GPS receivers accepting the TSIP protocol. (See Appendix A for details on key setup parameters.)

Table 4.1 **Satellite Mask Settings**

Mask	Setting
Elevation	5°
SNR	3
PDOP	12
PDOP Switch	6

Elevation Mask

Satellites below a 5° elevation are not used in the position solution. Although low elevation satellites can contribute to a lower/better PDOP, the signals from low elevation satellites are poorer quality, since they suffer greater tropospheric and ionospheric distortion than the signals from higher elevation satellites. These signals travel further through the ionospheric and tropospheric layers.

In addition, low elevation satellites can contribute to frequent constellation switches, since the signals from these satellites are more easily obscured by buildings and terrain. Constellation switches can cause noticeable jumps in the position output. Since worldwide GPS satellite coverage is generally excellent, it is not usually necessary to use satellites below a 5° elevation to improve GPS coverage time. In some applications, like urban environments, a higher mask may be warranted to minimize the frequency of constellation switches and the impact of reflected signals.

SNR Mask

Although the Lassen SQ GPS receiver is capable of tracking signals with SNRs as low as 0, the default SNR mask is set to 3 to eliminate poor quality signals from the fix computation and minimize constellation switching. Low SNR values may result from:

- Low Elevation Satellites
- Partially Obscured Signals (e.g. Dense Foliage)
- Multi-Reflected Signals (Multi-Path)

The distortion of signals and the frequent constellation switches associated with low-elevation satellites were discussed above. In mobile applications, the attenuation of signals by foliage is typically a temporary condition. Since the Lassen SQ GPS receiver can maintain lock on signals with SNRs as low as 0, it offers excellent performance when traveling through heavy foliage.

Multi-reflected signals, also known as Multi-path, can degrade the position solution. Multi-path is most commonly found in urban environments with many tall buildings and a preponderance of mirrored glass, which is popular in modern architecture. Multi-reflected signals tend to be weak (low SNR value), since each reflection attenuates the signal. By setting the SNR mask to 3 or higher, the impact of multi-reflected signals is minimized.

DOP Mask

Position Dilution of Precision (DOP) is a measure of the error caused by the geometric relationship of the satellites used in the position solution. Satellite sets which are tightly clustered or aligned in the sky will have a high DOP and will contribute to a lower position accuracy. For most applications, a DOP mask of 12 offers a satisfactory trade-off between accuracy and GPS coverage time. With world-wide GPS coverage now available, the DOP mask can be lowered even further for many applications without sacrificing coverage.

PDOP Switch

The default positioning mode for the Lassen SQ GPS receiver is Automatic. In this mode, the receiver attempts to generate a 3-dimensional (3D) position solution, when four or more satellites meeting the mask criteria are visible. If such a satellite set cannot be found, the receiver will automatically switch to 2-dimensional (2D) mode. The PDOP switch establishes the trade-off between 3D positioning and PDOP. With the PDOP Switch set to 6, the receiver will compute a 2D position with a HDOP below 6 rather than a 3D position with a PDOP greater than 6, even when four or more satellites are visible.

Note – PDOP Switch is only used in Auto mode.

Standard Operating Modes

The tracking mode controls the allocation of the receiver's tracking channels and the method used for computing position fixes.

Fix Modes

The Lassen SQ GPS receiver offers three positioning modes: 2D Manual, 3D Manual, and Automatic 2D/3D. Automatic 2D/3D is the default mode for the Lassen SQ GPS receiver. The positioning mode can be modified in receivers accepting TSIP commands. (See Appendix A for more information on the TSIP protocol.)

2D Manual Lassen SQ GPS Receiver

In 2D Manual mode, the Lassen SQ GPS receiver will only generate 2-dimensional (2D) position solutions (latitude and longitude only), regardless of the number of visible satellites. If the altitude is not entered, the receiver uses zero as the default altitude. The greater the deviation between the actual and default altitudes, the greater the error in the 2D position. For TSIP applications, enter local altitude in MSL/HAE via TSIP packet 2AH (see Appendix A).

3D Manual

In 3D Manual mode, the Lassen SQ GPS receiver will only generate 3-dimensional (3D) position solutions (latitude, longitude, and altitude). A 3D solution requires at least four visible satellites which pass the mask criteria. If less than four conforming satellites are visible, the Lassen SQ GPS receiver will suspend position data outputs.

2D/3D Automatic

The default operating mode for the Lassen SQ GPS receiver is 2D/3D Automatic. In this mode, the Lassen SQ GPS receiver attempts to generate a 3-dimensional (3D) position solution, if four or more satellites meeting the mask criteria are visible. If only three satellites are visible which meet the mask criteria, the Lassen SQ GPS receiver will automatically switch to 2-dimensional (2D) mode and will use the last calculated altitude, if available, or the default altitude in the position solution. In 2D/3D Automatic mode, the PDOP switch is active.

Position Accuracy

GPS position accuracy is degraded by atmospheric distortion, satellite geometry, satellite clock errors, and receiver clock errors. Effective models for atmospheric distortion of satellite signals have been developed to minimize the impact of tropospheric and ionospheric effects. The impact of satellite clock errors is minimized by incorporating the clock corrections transmitted by each satellite used in the position solution.

Coordinate Systems

Once the Lassen SQ GPS receiver achieves its first fix, it is ready to commence output of position, velocity, and time information. This information is output over serial communication channel in either the TSIP or NMEA protocol, as determined by the settings of the receiver. These protocols are defined in the Appendices. To change from one protocol to another, see Appendix A.

TSIP Coordinate Systems

TSIP has the widest choice of coordinate systems. The output format is chosen by TSIP command 0x35. The output formats include the following:

- LLA position — Latitude, longitude, altitude (LLA) according to the WGS-84 ellipsoid. Altitude can be chosen to be height above ellipsoid (HAE) or height above mean sea level (MSL).
- ENU velocity — ENU velocity is the velocity in East, North, and Up coordinates. These coordinates are easily converted to speed and heading.
- ECEF position and velocity — ECEF position and velocity is Earth-Centered, Earth-Fixed frame is a Cartesian coordinate frame with its center at the earth's center, the z-axis through the North Pole, and the x-axis through longitude 0 degrees, latitude 0 degrees. Velocity is reported relative to the same axes.

There are also two time coordinate systems:

- GPS time — GPS time is determined by an ensemble of atomic clocks operated by the Department of Defense (DOD).
- UTC time — UTC time is the world standard maintained by an ensemble of atomic clocks operated by government organizations around the world. UTC time replaced GMT (Greenwich Mean Time) as the world standard, in 1986.

GPS time is steered relative to Universal Coordinated Time (UTC). GPS does not recognize leap seconds resulting in a situation where GPS time is currently 13 seconds ahead of UTC time. Time tags for most output messages can be in either UTC time or GPS time, as chosen by TSIP command 0x35.

NMEA 0183

The NMEA 0183 protocol only supports LLA format and UTC time. Velocity is always described as horizontal speed and heading; vertical speed is not output.

Performance Characteristics

Update Rate

The Lassen SQ GPS receiver computes and outputs position solutions once per second, on the second. NMEA outputs can be scheduled at a slower rate using TSIP command 0x7A (see Appendix A).

Dynamic Limits

The dynamic operating limits for the Lassen SQ GPS receiver are listed below. These operating limits assume that the GPS module is correctly embedded and that the overall system is designed to operate under the same dynamic conditions.

Table 4.2 Lassen SQ GPS Receiver Operating Limits

Operation	Limit
Acceleration	4 g (39.2 m/s ²)
Jerk	20 m/s ³
Speed	500 m/s
Altitude	18,000 m

Note – The Lassen SQ GPS Receiver firmware contains an algorithm that allows either the speed limit or altitude limit to be exceeded, but not both. This allows the receiver to be used in high altitude (research balloon) applications without a special factory configuration.

Re-Acquisition

Re-acquisition time for a momentary signal blockages is typically under 2 seconds.

When a satellite signal is momentarily interrupted during normal operation, the receiver continues to search for the lost signal at the satellite's last known Doppler frequency. If the signal is available again within 15 seconds, the receiver will normally re-establish track within two seconds. If the lost signal is not re-acquired within 15 seconds, the receiver initiates a broader frequency search. The receiver will continue to search for the satellite until it falls below the elevation mask.

GPS Timing

In many timing applications, such as time/frequency standards, site synchronization systems and event measurement systems, GPS receivers are used to discipline local oscillators.

The GPS constellation consists of 24 orbiting satellites. Each GPS satellite contains a highly-stable atomic (Cesium) clock, which is continuously monitored and corrected by the GPS control segment. Consequently, the GPS constellation can be considered a set of 24 orbiting clocks with worldwide 24-hour coverage.

GPS receivers use the signals from these GPS “clocks” to correct its internal clock, which is not as stable or accurate as the GPS atomic clocks. GPS receivers like the Lassen SQ GPS receiver output a highly accurate timing pulse (PPS) generated by its internal clock, which is constantly corrected using the GPS clocks. This timing pulse is synchronized to UTC within ± 95 ns.

In addition to serving as a highly accurate stand-alone time source, GPS receivers are used to synchronize distant clocks in communication or data networks. This synchronization is possible since all GPS satellite clocks are corrected to a common master clock. Therefore, the relative clock error is the same, regardless of which satellite or satellites are used. For timing applications requiring a “common clock”, GPS is the ideal solution.

The position and time errors are related by the speed of light. Therefore, a position error of 100 meters corresponds to a time error of approximately 333 ns. The hardware and software implementation affects the GPS receiver's PPS accuracy level. The receiver's clocking rate determines the PPS steering resolution.

The Lassen SQ GPS receiver clocking rate is 3.126 MHz. This rate corresponds to a steering resolution of ± 160 ns.

Serial Time Output

Both the TSIP and NMEA protocols include time messages. See Report Packet 41 in Appendix A for a description of the time reports for each protocol.

Note – GPS time differs from UTC (Universal Coordinated Time) by a variable, integer number of seconds $UTC=(GPS\ time)-(GPS\ UTC\ offset)$.

As of April 2002, the GPS UTC offset was 13 seconds. The offset has historically increased by 1 second about every 18 months. System designers should plan to read the offset value as a part of the timing interface to obtain UTC. The GPS week number is in reference to a base week (Week #0), starting January 6, 1980.

Pulse-Per-Second (PPS)

The Lassen SQ GPS receiver provides a four microsecond wide, CMOS compatible TTL level Pulse-Per-Second (PPS). The PPS is a positive pulse available on pin 4 of the Lassen SQ GPS receiver power and I/O connector. The rising edge of the PPS pulse is synchronized with respect to UTC. The timing accuracy is ± 95 nanoseconds when valid position fixes are being reported.

The rising edge of the pulse is typically less than 20 nanoseconds. The distributed impedance of the attached signal line and input circuit can affect the pulse shape and rise time. The PPS can drive a load up to 5mA without damaging the module. The falling edge of the pulse should not be used. The PPS is always on (early PPS) and is driven by the Real Time Clock (RTC) until the receiver acquires GPS time from the satellite and is obtaining fixes. The PPS is output immediately after main power is applied, and continues even if the receiver loses GPS lock. The drift of the PPS, when the Lassen SQ GPS receiver is not tracking satellites, is unspecified and should not be used for synchronization.

Note – Trimble Navigation has measured better than 50 nanoseconds accuracy of the Lassen SQ GPS receiver PPS signal in static mode. For more information on timing applications, contact your Trimble sales representative.

System Architecture

The Lassen SQ GPS receiver (see Figure 4.3) uses eight processing channels operating on the L1 frequency of 1575.42 MHz and using the coarse acquisition (C/A) code. The module uses custom integrated circuitry designed by Trimble to track the GPS satellite signals. These ICs also contain support circuitry to the navigation processor. An integrated 32-bit microprocessor is used for tracking, computing a position, and performing the I/O operations.

The Lassen SQ GPS receiver receives the amplified GPS satellite signals through the antenna feed line connector and passes them to the RF down converter. A highly stable crystal reference oscillator operating at 12.504 MHz is used by the down converter to produce the signals used by the 8-channel signal processor. The 8-channel signal processor tracks the GPS satellite signals and extracts the carrier code information as well as the navigation data at 50 bits per second.

Operation of the tracking channels is controlled by the navigation processor. The tracking channels are used to track the highest eight satellites above the horizon. The navigation processor will then use the optimum satellite combination to compute a position. The navigation processor also manages the ephemeris and almanac data for all of the satellites, and performs the data I/O.

A large, bold, black serif letter 'A' centered within a light gray square. A horizontal line is positioned above the square, extending from the left edge of the page to the right edge of the square.

Trimble Standard Interface Protocol (TSIP)

The Trimble Standard Interface Protocol (TSIP) provides the system designer with over 20 commands that may be used to configure a GPS receiver for optimum performance in a variety of applications. TSIP enables the system designer to customize the configuration of a GPS module to meet the requirements of a specific application.

This appendix provides the information needed to make judicious use of the powerful features TSIP has to offer, to greatly enhance overall system performance, and to reduce the total development time. The reference tables beginning on page 70 will help you determine which packets apply to your application. For those applications requiring customization see Customizing Receiver Operations, page 71 for a detailed description of the key setup parameters. Application guidelines are provided for each TSIP Command Packet, beginning on page 84.

Interface Scope

The Trimble Standard Interface Protocol is used extensively in Trimble receiver designs. The protocol was originally created for the Trimble Advanced Navigation Sensor (TANS) and is colloquially known as the TANS protocol even though the protocol applies to many other devices.

The Lassen SQ GPS receiver has one serial I/O communications port. This port is a bi-directional control and data port utilizing Trimble Standard Interface Protocol (TSIP). This port may also be used to receive TSIP commands and to output industry standard ASCII-based NMEA messages. The data I/O port characteristics and other options are user programmable and can be stored in non-volatile flash memory.

The TSIP protocol is based on the transmission of packets of information between the user equipment and the unit. Each packet includes an identification code (1 byte, representing 2 hexadecimal digits) that identifies the meaning and format of the data that follows. Each packet begins and ends with control characters.

This document describes in detail the format of the transmitted data, the packet identification codes, and all available information over the output channel to allow the user to choose the data required for his particular application. As will be discussed, the receiver transmits some of the information (position and velocity solutions, etc.) automatically when it is available, while other information is transmitted only on request. Additional packets may be defined for particular products and these will be covered in the specifications for those products as necessary.

The TSIPCHAT utility, part of the GPS Tool Kit, is designed to exercise many of the TSIP packets.

Packet Structure

TSIP packet structure is the same for both commands and reports. The packet format is:

```
<DLE> <id> <data string bytes> <DLE> <ETX>
```

Where:

- <DLE> is the byte 0x10
- <ETX> is the byte 0x03
- <id> is a packet identifier byte, which can have any value excepting <ETX> and <DLE>.

The bytes in the data string can have any value. To prevent confusion with the frame sequences <DLE> <ID> and <DLE> <ETX>, every <DLE> byte in the data string is preceded by an extra <DLE> byte ('stuffing'). These extra <DLE> bytes must be added ('stuffed') before sending a packet and removed after receiving the packet. Notice that a simple <DLE> <ETX> sequence does not necessarily signify the end of the packet, as these can be bytes in the middle of a data string. The end of a packet is <ETX> preceded by an odd number of <DLE> bytes.

Multiple-byte numbers (integer, float, and double) follow the ANSI/IEEE Std. 754 IEEE Standard for binary Floating-Point Arithmetic. They are sent most-significant byte first. This may involve switching the order of the bytes as they are normally stored in Intel based machines. Specifically:

- UINT8 = Byte: An 8 bit unsigned integer.
- UINT16 = Word: A 16 bit unsigned integer.
- INT16 = Integer: A 16 bit integer.
- INT32 = Long: A 32 bit integer.
- UINT32 = ULong: A 32 bit unsigned integer.
- Single — Float, or 4 byte REAL has a precision of 24 significant bits, roughly 6.5 digits.
- Double — 8 byte REAL has a precision of 52 significant bits. It is a little better than 15 digits.

Automatic Output Packets

The Lassen SQ GPS receiver receiver is configured to automatically output the following packets. For minimal system implementations, these output packets provide all of the information required for operation including time, position, velocity, and receiver and satellite status and health. Position and velocity are reported using one or more of the packets listed below, depending on the selected I/O options. While there are other packets automatically output, the following packets provide the information most commonly used. No input packets are required.

Table A.1 Automatic Output Packets

Output Packet ID	Description	Reporting Interval
0x41	GPS time	5 seconds
0x42, 0x83, 0x4A, 0x84, 0x8F-20	position (choose packet with I/O options)	1 second
0x43, 0x56, 0x8F-20	velocity (choose packet with I/O options)	1 second
0x46	health of receiver	5 seconds
0x4B	machinecode/status (includes antenna fault detect)	5 seconds
0x6D	all-in-view satellite selection, DOPs, Fix Mode	1 second
0x82	DGPS position fix mode (only in DGPS mode)	1 second

Customizing Receiver Operations

For information on customizing receiver operations, see the following tables on selecting report data.

Automatic Position and Velocity Reports

The receiver automatically outputs position and velocity reports at set intervals. Automatic report packets are controlled by Packet 35.

Setting the control bits as indicated in the table below allows you to control which position and velocity packets are output.

Table A.2 Packet 35: Automatic Position and Velocity Reports Control Setting Bits

Report Packet ID	Description	Packet 0x35, Byte 0				Packet 0x35, Byte 1	
		Bit 0	Bit 1	Bit 4	Bit 5	Bit 0	Bit 1
0x42	single precision XYZ position	1		0			
0x83	double-precision XYZ position	1		1			
0x4A	single-precision LLA position		1 (default)	0			
0x84	double-precision LLA position		1	1			
0x43	velocity fix (XYZ, ECEF)					1	
0x56	velocity fix (ENU)						1 (default)
0x8F-20	LLA and ENU				1		

Initialization Packets to Speed Start-up

If you are not supplying the receiver with battery power when main power is off, you can still “warm-start” the receiver by sending the following commands after the receiver has completed its internal initialization and has sent Packet 82.

Table A.3

Input Byte	Description
0x2B	initial position
0x2E	initial time
0x38	almanac (for each SV)
0x38	almanac health
0x38	ionosphere page
0x38	UTC correction

Packets Output at Power-Up

The following table lists the messages output by the receiver at power-up. After completing its self-diagnostics, the receiver automatically outputs a series of packets which indicate the initial operating condition of the receiver. Messages are output as listed in the table below. After Packet 82 is output, the sequence is complete and the receiver is ready to accept commands.

Table A.4 Packet Power-up Output Messages

Output ID	Description	Notes
0x45	software version	--
0x46	receiver health	--
0x4B	machine code/status	--
As chosen, see Table A.3 default: 0 x 4A, 0 x 56	position/Velocity output	As chosen, see Table A.3.
0x41	GPS time	
82	DGPS position fix mode	--

Timing Packets

If you are using the Lassen SQ GPS receiver as a timing system, you may need to implement the following TSIP control commands.

Table A.5 Timing Packet TSIP Control Commands

Input ID	Description	Output ID
0x21	get the current GPS time	0x41
0x38-05	request UTC parameters	0x58-05

Satellite Data Packets

The following packets contain a variety of GPS satellite data.

Table A.6 Satellite Data Packet Data I/O Descriptions

Input ID	Description	Output ID
0x27	request signal levels	0x47
0x38	request/load satellite system data	0x58
0x3C	request tracking status	0x5C

Backwards Compatibility

TSIP packets implemented in the Lassen SQ GPS receiver are backward compatible with those used in Lassen SK II GPS receiver. For information regarding compatibility with other Trimble receivers, contact the Trimble Technical Assistance Center.

Recommended TSIP Packets

Table A.7 Recommended TSIP Packet Data

Function	Description	Input	Output
Protocol and port setup	set/query port configuration	0xBC	0xBC
	set/query NMEA configuration	0x7A	0x7B
	set/query I/O options (autoreport and format options)	0x35	0x55
Navigation	GPS time	0x21	0x41
	position & velocity (superpacket)	0x8E-20 or 0x37 or auto	0x8F-20
	double-precision LLA	0x37/auto	0x84
	double-precision XYZ	0x37/auto	0x83
	ENU velocity	0x37/auto	0x56
	XYZ velocity	0x37/auto	0x43
Satellite and tracking information	query receiver state (health)	0x26	0x46, 0x4B
	query current satellite selection	0x24	0x6D
	query signal levels	0x27	0x47
	query satellite information (azimuth, elevation, etc.)	0x3C	0x5C
Receiver settings	query software version	0x1F	0x45
	query receiver ID & error status	0x26	0x4B, 0x46
	set/query receiver configuration	0xBB	0xBB
	set altitude for 2D mode	0x2A	0x4A
	disable PV/altitude filters	0x70	0x70
	set/query positioning mode (2D v. 3D)	0xBB	0xBB
GPS System	query/load GPS system data	0x38	0x58

Table A.7 (Continued) Recommended TSIP Packet Data

Function	Description	Input	Output
Initialization	full reset (clear battery backup and/or non-volatile settings)	0x1E	
	soft reset	0x25	
	set GPS time	0x2E	0x4E
	set exact LLA	0x32	
	set approx. XYZ	0x23	
	set approx. LLA	0x2B	
	set exact XYZ	0x31	

Command Packets Sent to the Receiver

The table below summarizes the command packets sent to the receiver. The table includes the input Packet ID, a short description of each packet, and the associated response packet. In some cases, the response packets depend on user-selected options. These selections are covered in the packet descriptions beginning on page 84.

Table A.8 User-Selected Command Packet Options

Input ID	Packet Description	Output ID
0x1E	clear battery back-up/reset	See Note 1
0x1F	software version	0x45
0x21	current time	0x41
0x23	initial position (XYZ ECEF)	--
0x24	request receiver position fix mode	0x6D
0x25	soft reset & self-test	See Note 1
0x26	receiver health	0x46, 0x4B
0x27	signal levels	0x47
0x2A	altitude for 2-D mode	0x4A

Table A.8 User-Selected Command Packet Options (Continued)

Input ID	Packet Description	Output ID
0x2B	initial position (Lat, Lon, Alt)	--
0x2D	oscillator offset	0x4D
0x2E	set GPS time	0x4E
0x31	accurate initial position (XYZ Cartesian ECEF)	--
0x32	accurate initial position	--
0x35	I/O options	0x55
0x37	status and values of last position and velocity	0x57
0x38	load or request satellite system data	0x58
0x3C	tracking status	0x5C, see Note 2
0x70	filter configuration	0x70
0x7A	set/request NMEA output configuration	0x7B
0xBB	set receiver configuration	0xBB
0xBC	set port configuration	0xBC
0x8E-20	last fix with extra information (fixed point)	0x8F-20
0x8E-26	Store settings in Flash memory.	0x8F-26

***Note 1** – Output is determined by packet 0 x 35. See Tabl eA.4 to determine which messages are output at power-up.*

***Note 2** – No response sent if data is not available.*

Report Packets Sent by the Receiver to the User

The table below summarizes the packets output by the receiver. The response packets may depend on user-selected options. These selections are described on page84.

Table A.9 User-Selected Report Packet Options

Output ID	Packet Description	Input ID
0x41	GPS time	0x21, auto
0x42	single-precision XYZ position	0x37, auto
0x43	velocity fix (XYZ ECEF)	0x37, auto
0x45	software version information	0x1F, power-up
0x46	health of Receiver	0x26, auto, power-up
0x47	signal level for all satellites	0x27
0x4A	single-precision LLA position	0x37, auto
0x4B	machine code/status	0x26, auto, power-up
0x4D	oscillator offset	0x2D
0x4E	response to set GPS time	0x2E
0x55	I/O options	0x35
0x56	velocity fix (ENU)	0x37, auto
0x57	information about last computed fix	0x37
0x58	GPS system data/acknowledge	0x38
0x5C	satellite tracking status	0x3C
0x6D	all-in-view satellite selection	0x24, auto
0x82	differential position fix mode	0x62, auto
0x83	double-precision XYZ	auto, 0x37
0x84	double-precision LLA	auto, 0x37
0x8F-20	last fix with extra information (fixed point)	auto, 0x37, 0x8E-20
0xBB	GPS navigation configuration	0xBB
0xBC	Receiver port configuration	0xBC

Key Setup Parameters or Packet BB

Selecting the correct operating parameters has significant impact on receiver performance. Packet 0xBB (set receiver configuration) controls the key setup parameters.

The default operating parameters allow the receiver to perform well in almost any environment. The user can optimize the receiver to a particular application if the vehicle dynamics and expected level of obscuration are understood. If the receiver is then taken out of this environment, the specifically tuned receiver may not operate as well as a receiver with the default options.

The table below lists suggested parameter selections as a function of obscuration and whether accuracy or fix density is important. In this table, NA indicates that the operating parameter is not applicable, DC (don't care) indicates that the user may choose the operating parameter.

Table A.10 Setup Parameters in Packet 0xBB

Parameter	Accuracy	Fixes	Factory Default
Fix mode	Man 3D	AUTO	AUTO
Dynamics code	Land	Land	Land
Elevation mask	10°	5°	5°
Signal mask	6.0	4.0	3.0
DOP mask	6.0	12.0	12.0
DOP switch	NA	8.0	6.0
DGPS correction age	10 Seconds	N/A	30 Seconds

The default values in Table A.10 allow the receiver to operate well under the most varied and demanding conditions. A user may choose to change the default parameters if the receiver is only required to perform in a specific or limited environment. The user should be warned that when the receiver is exposed to operating conditions which are different from the conditions described by the user setup, then the performance may be degraded.

Initially, the user must consider the environment in which the receiver is expected to operate. There is a trade-off between how frequently a position fix is output versus the absolute accuracy of the fix. The user must decide which takes priority and then make the appropriate selections. This becomes increasingly important when frequent satellite blockages are expected, as in downtown “urban canyon” environments and heavily foliated areas.

Following is a description of the key fields in Packet 0xBB.

Set Fix Mode

Packet 0xBB is used to choose the appropriate position fix mode for your application: 2-D, 3-D or AUTO. The default mode is AUTO 2-D/3-D, where the receiver first attempts to obtain a 3-D solution with a PDOP below the DOP switch. If this is not possible, then the receiver attempts to obtain a 2-D solution with a DOP less than the DOP mask. This mode supplies fairly continuous position fixes even when there is frequent obscuration. This mode is preferable for most land or air applications, where altitude changes are occurring and there is occasional obscuration.

The highest accuracy fix mode is 3-D manual, where altitude is always calculated along with the latitude, longitude, and time. However, this requires four satellites with a PDOP below the DOP mask set in Packet BB in order to obtain a position. Normally, this will provide the most accurate solution. Thus, if only 3-D solutions are desired, then the user should request 3-D manual mode. Depending on how the PDOP mask is set, this may be restrictive when the receiver is subjected to frequent obscuration, or when the geometry is poor due to an incomplete constellation.

Alternatively, if the user only wants a 2-D solution, then 2-D manual should be requested. In this case, the receiver uses either the last altitude obtained in a 3-D fix, or the altitude supplied by the user. However, any error in the assumed altitude will affect the accuracy of the latitude and longitude solution.

When using the 2-D mode, expect fixes with accuracies which are at best as accurate as the supplied altitude. If a marine user enters sea-level as the altitude, then small errors in the horizontal solution will occur when the sea state is rough or there are high tidal variations. However, these errors may be smaller than the altitude errors induced by SA, so 2-D may be preferable for a marine user who does not want to observe “unusual” altitudes.

Dynamics Code

The feature default is LAND mode, where the receiver assumes a moderate dynamic environment. In this case, the satellite search and re-acquisition routines are optimized for vehicle type environments. In SEA mode, the search and re-acquisition routines assume a low acceleration environment and reverts to user entered altitude in 2-D auto. In AIR mode, the search and re-acquisition routines are optimized for high acceleration conditions.

Elevation Mask

This is the minimum elevation angle for satellites to be used in a solution output by the receiver. Satellites which are near the horizon are typically more difficult to track due to signal attenuation, and are also generally less accurate due to higher variability in the ionospheric and tropospheric corruption of the signal. When there are no obstructions, the receiver can generally track a satellite down to near the horizon. However, when this mask is set too low, the receiver may experience frequent constellation switching due to low elevation satellites being obscured.

Frequent constellation switching is undesirable because position jumps may be experienced when SA is present and DGPS is not available to remove these effects. The benefit of a low elevation mask is that more satellites are available for use in a solution and a better PDOP may be yielded. The current mask is set to five degrees and provides a reasonable trade-off of the benefits and drawbacks. High accuracy users may prefer a mask angle around ten degrees, where the ionosphere and troposphere begin to be more predictable

Signal Level Mask

This mask defines the minimum signal strength for a satellite used in a solution. There is some internal hysteresis on this threshold which allows brief excursions below the threshold if lock is maintained and the signal was previously above the mask. The factory default mask has been set to 3 (AMU). High accuracy users may use a slightly higher mask of 6.0-8.0, since weaker measurements may be slightly noisier and are often caused by reflected signals which provide erroneous ranges.

One should also resist the temptation to set the elevation and SNR masks too low. The satellite geometry is sometimes improved considerably by selecting low elevation satellites. They are, however, subject to significant signal degradation by the greater ionospheric and tropospheric attenuation that occurs. They are also subject to more obscuration by the passing scenery when the receiver is in a moving vehicle. The code phase data from those satellites is therefore more difficult to decode and therefore has more noise.

Note – A level of hysteresis in the signal level mask is allowed in the core operating software. The hysteresis allows the receiver to continue using satellite signals which fall slightly below the mask and prevents the receiver from incorporating a new signal until the signal level slightly exceeds the mask. This feature minimizes constellation changes caused by temporary fluctuations in signal levels.

DOP Mask and Switch

The DOP mask is the maximum DOP limit for any 2-D or 3-D position solution will be made. The DOP switch is the level at which the receiver stops attempting a 3-D solution, and tries for a 2-D solution when in automatic 2-D, 3-D mode. The switch level has no effect in either manual mode. Raising the DOP mask will generally increase the fix density during obscuration, but the fixes with the higher DOP will be less accurate (especially with SA present). Lowering the mask will improve the average accuracy at the risk of lowering the fix density.

Packet Descriptions

Command Packet 0x1E - Clear Battery Backup, then Reset

This packet commands the GPS receiver to clear all battery back-up data and to perform a software reset. This packet contains one data byte.

Table A.11 Command Packet 0x1E Format

Byte	Item	Type	Value	Definition
0	Reset mode	Unit 8	0x4B 0x46	Cold start: Erase BBRAM and restart Factory reset: Erase BBRAM and Flash and restart

Warning – All almanac, ephemeris, current position, mode, and communication port setup information is lost when executing the “Factory Reset” command. In normal use this packet should not be sent.

Warning – It is very helpful to keep a fresh copy of the current almanac, which is stored in the file GPSALM.DAT collected by the TSIPCHAT command “!”. This allows near-instantaneous recuperation by the receiver in case of power loss or clearing of battery-backed memory by using the TSIPCHAT command “@” to load it back into the receiver memory.

Command Packet 0x1F - Request Software Versions

This packet requests information about the version of software running in the Navigation and Signal Processors. This packet contains no data. The GPS receiver returns Packet 0x45.

Command Packet 0x21 - Request Current Time

This packet requests current GPS time. This packet contains no data. The GPS receiver returns Packet 0x41.

Command Packet 0x23 - Initial Position (XYZ Cartesian ECEF)

This packet provides the GPS receiver with an approximate initial position in XYZ coordinates. This packet is useful if the user has moved more than about 1,000 miles since the previous fix. (Note that the GPS receiver can initialize itself without any data from the user; this packet merely reduces the time required for initialization.) **This packet is ignored if the receiver is already calculating positions.** The data format is shown below.

Note – To initialize using the Latitude-Longitude-Altitude representation, use Command Packet 0x2B.

Table A.12 Command Packet 0x23 Data Format

Byte	Item	Type	Units
0-3	X	Single	Meters
4-7	Y	Single	Meters
8-11	Z	Single	Meters

Command Packet 0x24 - Request GPS Receiver Position Fix Mode

This packet requests current position fix mode of the GPS receiver. This packet contains no data. The GPS receiver returns Packet 0x6D.

Command Packet 0x25 - Initiate Soft Reset & Self Test

This packet commands the GPS receiver to perform a software reset. This is equivalent to cycling the power. The GPS receiver performs a self-test as part of the reset operation. This packet contains no data. Following completion of the reset, the receiver will output the start-up messages (see Table A.4). The GPS receiver sends Packet 0x45 only on power-up and reset (or on request); thus if Packet 0x45 appears unrequested, then either the GPS receiver power was cycled or the GPS receiver was reset.

Command Packet 0x26 - Request Health

This packet requests health and status information from the GPS receiver. This packet contains no data. The GPS receiver returns Packet 0x46 and 0x4B.

Command Packet 0x27 - Request Signal Levels

This packet requests signal levels for all satellites currently being tracked. This packet contains no data. The GPS receiver returns Packet 0x47.

Command Packet 0x2A - Altitude for 2-D Mode

Reference Altitude is the altitude used for manual 2-D positions if the altitude flag is set. Altitude is in units of HAE WGS-84 or MSL depending on the selected I/O options for the position (see page 92).

The Altitude Flag determines whether or not the Reference Altitude will be used. If set, it will be used. If cleared, altitude hold (last 3-D altitude) is used.

Note – With no data byte, this packet requests the current values of these altitude parameters. In this case, the GPS receiver returns Packet 4A.

This packet sets or requests the altitude parameters used for the Manual 2-D mode: Reference Altitude and Altitude Flag. Packet 0x4A (9 byte format) is returned.

Table A.13 Packet 0x2A Set Reference Altitude Description

Byte	Item	Type	Definition
0-3	Altitude	Single	Reference altitude for 2-D

Table A.14 Packet 0x2A Clear Reference Altitude Description

Byte	Item	Type	Value	Definition
0	Altitude Flag	UINT8	0 x FF	Clear Altitude flag

Note – With no data bytes, this packet requests the current values of these altitude parameters. In this case, the GPS receiver returns Packet 4A (9 byte format).

Command Packet 0x2B - Initial Position (Latitude, Longitude, Altitude)

This packet provides the GPS receiver with an approximate initial position in latitude and longitude coordinates (WGS-84). This packet is useful if the user has moved more than about 1,000 miles since the previous fix. (Note that the GPS receiver can initialize itself without any data from the user; this packet merely reduces the time required for initialization.) **This packet is ignored if the receiver is already calculating positions.** The data format is shown in the table below.

Table A.15 Command Packet 0x2B Data Format

Byte	Item	Type	Units
0-3	Latitude	Single	Radians, north
4-7	Longitude	Single	Radians, east
8-11	Altitude	Single	Meters

Note – To initialize with ECEF position, use Command Packet 0x23.

Command Packet 0x2D - Request Oscillator Offset

This packet requests the calculated offset of the GPS receiver master oscillator. This packet contains no data. The GPS receiver returns Packet 0x4D. This packet is used mainly for service. The permissible oscillator offset varies with the particular GPS receiver unit.

Command Packet 0x2E - Set GPS Time

This packet provides the approximate GPS time of week and the week number to the GPS receiver. The GPS receiver returns Packet 0x4E. The data format is shown below. The GPS week number reference is Week # 0 starting January 6, 1980. The seconds count begins at the midnight which begins each Sunday morning. This packet is usually not required when the battery back-up voltage is applied as the internal clock keeps time to sufficient accuracy. **This packet is ignored if the receiver has already calculated the time from tracking a GPS satellite.**

Note – See report Packet 41 for information on the Extended GPS week number.

Table A.16 Command Packet 0x2E Data Formats

Byte	Item	Type	Units
0-3	GPS time of week	Single	Seconds
4-5	Extended GPS week number	INT16	Weeks

Command Packet 0x31 - Accurate Initial Position (XYZ Cartesian ECEF)

This packet is identical in content to Packet 0x23. This packet provides an initial position to the GPS receiver in XYZ coordinates. However, the GPS receiver assumes the position provided in this packet to be accurate. This packet is used for satellite acquisition aiding in systems where another source of position is available. For acquisition aiding, the position provided by the user to the GPS receiver in this packet should be accurate to a few kilometers. For high-accuracy time transfer, position should be accurate to a few meters.

Table A.17 Command Packet 0x31 Data Format

Byte	Item	Type	Units
0-3	X-axis	Single	Meters
4-7	Y-axis	Single	Meters
8-11	Z-axis	Single	Meters

Command Packet 0x32 - Accurate Initial Position, (Latitude, Longitude, Altitude)

This packet is identical in content to Packet 0x2B. This packet provides the GPS receiver with an accurate initial position in latitude, longitude, and altitude coordinates. However, the GPS receiver assumes the position provided in this packet to be accurate. This packet is used for satellite acquisition aiding in systems where another source of position is available. For acquisition aiding, the position provided by the user to the GPS receiver in this packet should be accurate to a few kilometers. For high-accuracy time transfer, position should be accurate to a few meters.

Table A.18 Command Packet 0x32 Data Format

Byte	Item	Type	Units
0-3	Latitude	Single	Radians, North
4-7	Longitude	Single	Radians, East
8-11	Altitude	Single	Meters

Command Packet 0x35 - Set/Request I/O Options

This packet requests the current I/O options and allows the I/O options to be set as desired. To request the option settings without making any changes, send the packet with no data bytes. To change the option settings, include four data bytes with the values. The I/O options, their default settings, and the byte values for all possible configurations are shown below.

The Set/Request I/O options are stored in battery-backed memory. To store them in non-volatile RAM (Flash) use the 0x8E-26 command. The GPS receiver returns Packet 0x55. See Table A.4 for information on saving the settings to non-volatile memory. These abbreviations apply to the following table: ALT (Altitude), ECEF (Earth-centered, Earth-fixed), XYZ (Cartesian coordinates), LLA (latitude, longitude, altitude), HAE (height above ellipsoid), WGS-84 (Earth model (ellipsoid)), MSL geoid (mean sea level), and UTC (coordinated universal time).

Table A.19 Command Packets 0x35 and 0x55 Data Descriptions

Byte	Bit	Item	Type	Value	Definition	Associated Packets
Position						
0	0 (LSB)	XYZ ECEF	Bit	0 1	XYZ ECEF output off XYZ ECEF output on	0x42 (single) 0x83 (double)
	1	LLA Output	Bit	0 1	LLA output off LLA output on	0x4A (single) 0x84 (double)
	2	LLA ALT Output	Bit	0 1	HAE (Note 1) MSL geoid	0x4A / 0x84 0x8F-17 0x8F-18
	3	ALT input	Bit	0 1	HAE (Note 1) MSL geoid.	0x2A
	4	Precision-of-position output	Bit	0 1	Send single-precision packet. Send double-precision packet.	0x42, 0x4A 0x83, 0x84
	5	Super Packet Output	Bit	0 1	Output no Super Packets. Output all enabled Super Packets.	0x8F-20 (Note 2)
	6-7	reserved				
Velocity						
1	0	XYZ ECEF	Bit	0 1	XYZ ECEF output off XYZ ECEF output on	0x43
	1	ENU output	Bit	0 1	ENU output off ENU output on	0x56
	2-7	reserved				
Timing						
2	0	Time Type	Bit	0 1	GPS time UTC	0x42, 0x43, 0x4A, 0x83, 0x84, 0x56
	1-7	reserved				

Table A.19 Command Packets 0x35 and 0x55 Data Descriptions (Continued)

Byte	Bit	Item	Type	Value	Definition	Associated Packets
Auxiliary/Pseudo Range Measurements						
3	0	Raw measuring	Bit	0	Raw measurements off	0x5A
				1	Raw measurements on	
	1	Raw / Filtered	Bit	0	Raw PR's in 5A	0x5A (Note 3)
				1	Filtered PR's in 5A	
	2	reserved				
3		Output dB Hz instead of AMU	Bit	0	Output dB Hz	0x5A, 0x5C, 0x47
				1	Output AMU's	
4-7	reserved					

***Note 1** – In the current version of the Lassen SQ GPS receiver, the output HAE altitude is always in the WGS-84 datum. The input HAE altitude is always in the WGS-84 datum.*

***Note 2** – Packet 8E must be used to specify which superpacket is to be output.*

***Note 3** – Automatic output of 0x5A messages is supported in the Lassen SQ GPS receiver for backwards compatibility with older TSIP applications.*

Command Packet 0x37 - Request Status and Values of Last Position and Velocity

This packet requests information regarding the last position fix and is only used when the receiver is not automatically outputting positions. The GPS receiver returns Report Packet 0x57 followed by the position/velocity packets specified in Command Packet 0x35.

Command Packet 0x38 - Request/Load Satellite System Data

This packet requests current satellite data (almanac, ephemeris, etc.) or permits loading initialization data from an external source (for example, by extracting initialization data from an operating GPS receiver unit via a data logger or computer and then using that data to initialize a second GPS receiver unit). The GPS receiver returns Packet 0x58. (Note that the GPS receiver can initialize itself without any data from the user; it merely requires more time.)

To request data without loading data, use only bytes 0 through 2; to load data, use all bytes. Before loading data, observe the caution notice below. The data formats are located in Report Packet 0x58.

Table A.20 Command Packet 0x38 Data Formats

Byte	Item	Type	Value	Definition
0	Operation	UINT8	1 2	Request data from Lassen SQ GPS receiver; Load data into Lassen SQ GPS receiver
1	Type of data	UINT8	2 3 4 5 6	Almanac Health page, T_oa, WN_oa Ionosphere UTC Ephemeris
2	Sat PRN#	UINT8	0 1 - 32	Data that is not satellite - ID specific Satellite PRN number
3	Length (n)	UINT8		Number of bytes of data to be loaded
4 to n+3	Data	UINT8		Satellite data

Warning – Proper structure of satellite data is critical to Lassen SQ GPS receiver operation. Requesting data is not hazardous; Loading data improperly is hazardous. Use this packet only with extreme caution. The data should not be modified in any way. It should only be retrieved and stored for later download. The ephemeris data cannot be loaded into the receiver.

Command Packet 0x3C - Request Current Satellite Tracking Status

This packet requests the current satellite tracking status. The GPS receiver returns Packet 0x5C if data is available.

Table A.21 Command Packet 0x3C Data Format

Byte	Item	Type	Value	Definition
0	Satellite #	UINT8	0 1 - 32	All satellites in the current tracking set desired satellite

Report Packet 0x41 - GPS Time

This packet provides the current GPS time of week and the week number. The GPS receiver sends this packet in response to Packet 0x21 and during an automatic packets update cycle. Update cycles occur approximately every 5 seconds. The data format is shown below.

Table A.22 Report Packet 0x41 Data Formats

Byte	Item	Type	Units
0-3	GPS time of week	Single	seconds
4-5	Extended GPS week number	INT16	weeks
6-9	GPS UTC offset	Single	seconds

Note – UTC time lags behind GPS time by an integer number of seconds; $UTC = (GPS\ time) - (GPS\ UTC\ offset)$.

Warning – GPS week number runs from 0 to 1023 and then cycles back to week #0. week # 0 began January 6, 1980. The first cycle back to week #0 was on August 22, 1999. The extended GPS week number however, does not cycle back to 0. For example: the week # for August 22, 1999 = 1024; the Week # for April 1, 2002 = 1160.

The seconds count begins with “0” each Sunday morning at midnight GPS time. A negative indicated time-of-week indicates that time is not yet known; in that case, the packet is sent only on request. The following table shows the relationship between the information in Packet 0x41, and the Packet 0x46 status code.

Table A.23 Packets 0x41 and 0x46 Status Code Relationships

Approximate Time Accuracy	Time Source	Sign (TOW)	Packet 46 Status Code
none	no time at all	-	0x01
unknown	approximate time from real-time clock or Packet 2E	+	0x01
20-50 msec + clock drift	time from satellite	+	0x02 - 0x0C
full accuracy	time from GPS solution	+	0x00

Note – Before using the GPS time from Packet 0x41, verify that the Packet 0x46 status code is 00 (“Doing position fixes”). This will ensure the most accurate GPS time.

Report Packet 0x42 - Single-Precision Position Fix, XYZ ECEF

This packet provides current GPS position fix in XYZ ECEF coordinates. If the I/O “position” option is set to XYZ ECEF (byte 0: bit 0, Packet 0x35) and the I/O Precision-of-Position Output (byte 0: bit 4, Packet 0x35) is set to single-precision, then the GPS receiver sends this packet each time a fix is computed. The data format is shown below.

Table A.24 Report Packet 0x42 Data Formats

Byte	Item	Type	Units
0-3	X	Single	meters
4-7	Y	Single	meters
8-11	Z	Single	meters
12-15	Time-of-fix	Single	seconds

The time-of-fix is in GPS time or UTC as selected by the I/O “timing” option. Packet 83 provides a double-precision version of this information.

Report Packet 0x43 - Velocity Fix, XYZ ECEF

This packet provides current GPS velocity fix in XYZ ECEF coordinates. If the I/O velocity option is set to XYZ ECEF (byte 1, bit 0, Packet 0x35), then the GPS receiver sends this packet each time a fix is computed. The data format is shown below.

Table A.25 Report Packet 0x43 Data Formats

Byte	Item	Type	Units
0-3	X velocity	Single	meters/second
4-7	Y velocity	Single	meters/second
8-11	Z velocity	Single	meters/second
12-15	bias rate	Single	meters/second
16-19	time-of-fix	Single	seconds

The time-of-fix is in GPS time or UTC as selected by the I/O “timing” option (byte 2, bit 0, Packet 0x35).

Report Packet 0x45 - Software Version Information

This packet provides information about the version of software in the Navigation and Signal Processors. The GPS receiver sends this packet after power-on and in response to Packet 0x1F.

Table A.26 Report Packet 0x45 Data Formats

Byte	Item	Type
0	Major version number	UINT8
1	Minor version number	UINT8
2	Month	UINT8
3	Day	UINT8
4	Year number minus 1900	UINT8
5	Major revision number	UINT8
6	Minor revision number	UINT8
7	Month	UINT8
8	Day	UINT8
9	Year number minus 2000	UINT8

The first 5 bytes refer to the Navigation Processor and the second 5 bytes refer to the Signal Processor.

Report Packet 0x46 - Health of Receiver

This packet provides information about the satellite tracking status and the operational health of the receiver. The receiver sends this packet after power-on or software-initiated resets, in response to Packet 0x26 and, every five seconds. Packet 0x4B is always sent along with this packet.

Note – If receiver status changes between five second outputs, no notification is given until the next cycle.

Table A.27 Report Packet 0x46 Data Formats

Byte	Bit	Item	Type	Value	Definition
0		Status code	UINT8	0x00 0x01 0x02 0x03 0x08 0x09 0x0A 0x0B 0x0C	Doing position fixes Don't have GPS time yet Need initialization (0=normal, 1=shutdown due to RF initialization timeout) PDOP is too high No usable satellites Only 1 usable satellite Only 2 usable satellites Only 3 usable satellites The chosen satellite is unusable
1	0	Battery backup	Bit	0 1	OK BBRAM was not available at start-up
1	4	Antenna feedline fault		0 1	OK short

The error codes in Byte 1 of Packet 0x46 are encoded into individual bits within the byte. The bit positions and their meanings are shown below.

Note – After status is detected, its bit remains set until the receiver is reset.

Report Packet 0x47 - Signal Levels for all Satellites

This packet provides received signal levels for all satellites currently being tracked or on which tracking is being attempted (i.e., above the elevation mask and healthy according to the almanac). The receiver sends this packet only in response to Packet 0x27. The data format is shown below.

Table A.28 Report Packet 0x47 Data Formats

Byte	Item	Type
0	Count	UINT8
1	Satellite number 1	UINT8
2- 5	Signal level 1	Single
6	Satellite number 2	UINT8
7-10	Signal level 2	Single
(etc.)	(etc.)	(etc.)

Up to 8 satellite number/signal level pairs may be sent, indicated by the count field. Signal level is normally positive. If it is zero then that satellite has not yet been acquired. If it is negative then that satellite is not currently in lock. The absolute value of signal level field is the last known signal level of that satellite.

Note – The signal level provided in this packet is a linear measurement of the signal strength after correlation or de-spreading. Units, either AMU or dBHz, are controlled by Packet 0x35.

Report Packet 0x4A - 20 Byte Format

This packet provides current GPS position fix in LLA (latitude, longitude, and altitude) coordinates. If the I/O Position option is set to LLA and the I/O Precision-of-Position Output is set to single-precision (all controlled by Packet 35), then the receiver sends this packet each time a fix is computed. Command Packet 35 controls position output (XYZ or LLA) and (single or double) output precision. The data format is shown in below.

Table A.29 Report Packet 0x4A Data Formats

Byte	Item	Type	Units
0-3	Latitude	Single	radians; + for north, - for south
4-7	Longitude	Single	radians; + for east, - for west
8-11	Altitude	Single	meters (HAE or MSL)
2-15	Clock Bias	Single	meters
6-19	Time-of-Fix	Single	seconds (GPS or UTC)

The default altitude conversion is WGS-84. Altitude is referred to the datum ellipsoid or the MSL Geoid, depending on which I/O “LLA altitude” option is selected. The time-of-fix is in GPS time or UTC, depending on which I/O “timing” option is selected. This packet also is sent at start-up with a negative time-of-fix to report the current known position. Packet 0x84 provides a double-precision version of this information

Warning – When converting from radians to degrees, significant and readily visible errors will be introduced by use of an insufficiently precise approximation for the constant PI). The value of the constant PI as specified in ICD-GPS-200 is 3.1415926535898.

Report Packet 0x4A - 9 Byte Format

Report Packet 0x4A is also sent in response to the setting or requesting of the Reference Altitude Parameters using Command Packet 0x2A. These parameters can be used in the Manual 2-D mode.

Reference Altitude

The altitude used for manual 2-D positions if the altitude flag is set. Altitude is in units of HAE WGS-84 or MSL depending on the selected I/O options set for positioning with Command Packet 35.

Altitude Flag

A flag that determines whether or not the Reference Altitude will be used. If set, it will be used. If cleared, altitude hold (last 3-D altitude) will be used. The data format is shown in the following table.

Table A.30 Reference Altitude

Byte	Item	Type	Units
0-3	Reference Altitude	Single	Meters
4-7	Reserved	Single	
8	Altitude flag	UINT8	

Report Packet 0x4B - Machine/Code ID and Additional Status

The receiver transmits this packet in response to packets 0x25 and 0x26 and following a change in state. In conjunction with Packet 0x46, “health of receiver,” this packet identifies the receiver and may present status messages. The machine ID can be used by equipment communicating with the receiver to determine the type of receiver to which the equipment is connected. Then the interpretation and use of packets can be adjusted accordingly.

Table A.31 Report Packet 0x4B Data Formats

Byte	Item	Type/	Definition
0	Machine ID	UINT8	Receiver dependent
1	Status 1	UINT8	See Table A.31
2	Status 2	UINT8	Bit 0 = Super packets supported

The status codes are encoded into individual bits within the bytes. The bit positions and their meanings are listed in the table below.

Table A.32 Report Packet 0x4B Bit Positions and Descriptions

Status 1 Bit Positions	Meaning if bit value = 1
0 (LSB)	Not used
1	Real-time Clock was not available at power-up.
2	Not used
3	The almanac stored in the receiver is not complete and current.
4-7	Not used

Report Packet 0x4D - Oscillator Offset

This packet provides the current value of the receiver master oscillator offset in Hertz at carrier. This packet contains one single precision number. The receiver sends this packet in response to Packet 0x2D. The permissible offset varies with the receiver unit.

Report Packet 0x4E - Response to Set GPS Time

Indicates whether the receiver accepted the time given in a Set GPS time packet. the receiver sends this packet in response to Packet 0x2E. This packet contains one byte.

Table A.33 Report Packet 0x4E Data Formats

Value	Meaning
ASCII "Y"	The receiver accepts the time entered via Packet 2E. The receiver has not yet received the time from a satellite.
ASCII "N"	The receiver does not accept the time entered via Packet 2E. The receiver has received the time from a satellite and uses that time. The receiver disregards the time in Packet 0x 2E.

Report Packet 0x55 - I/O Options

These abbreviations apply to the following table: ALT (Altitude), ECEF (Earth-centered, Earth-fixed), XYZ (Cartesian coordinates), LLA (latitude, longitude, altitude), HAE (height above ellipsoid), WGS-84 (Earth model (ellipsoid)), MSL geoid (Earth (mean sea level) mode), and UTC (coordinated universal time).

Table A.34 Command Packets 0x55 and 0x35 Data Descriptions

Byte	Bit	Item	Type	Value	Definition
Position					
0	0	XYZ ECEF	Bit	0 1	XYZ ECEF output off XYZ ECEF output on
0	1	LLA Output	Bit	0 1	LLA output off LLA output on
0	2	LLA ALT Output	Bit	0 1	HAE (WGS-84 datum) MSL geoid
0	3	ALT input	Bit	0 1	HAE (WGS-84 datum). MSL geoid
0	4	Precision-of-position output	Bit	0 1	Send single-precision packet. Send double-precision packet.
0	5	Super Packet Output	Bit	0 1	Output no Super Packets. Output all enabled Super Packets.
0	6-7	reserved			
Velocity					
1	0	XYZ ECEF	Bit	0 1	XYZ ECEF output off XYZ ECEF output on
1	1	ENU output	Bit	0 1	ENU output off ENU output on
1	2-7	reserved			

Table A.34 Command Packets 0x55 and 0x35 Data Descriptions (Continued)

Byte	Bit	Item	Type	Value	Definition
Timing					
2	0	Time Type	Bit	0 1	GPS time UTC
2	1-7	reserved			
Auxiliary / Range Measurements					
3	0	Raw measuring	Bit	0 1	Raw measurements off Raw measurements on
3	1	Raw / Filtered	Bit	0 1	Raw PR's in 0x5A Filtered PR's in 0x5A
3	2	reserved			
3	3	Output dB Hz instead of AMU	Bit	0 1	Output dB Hz Output AMU's
3	4-7	reserved			

Note 1 – See the associated superpacket output, described later in this appendix. Packet 8E must be used to specify which superpacket is to be output.

Note 2 – Automatic output of 0x5A raw measurement messages is supported in the Lassen SQ GPS receiver for backwards compatibility with older TSIP applications.

Report Packet 0x56 - Velocity Fix, East-North-Up (ENU)

If East-North-Up (ENU) coordinates have been selected for the I/O “velocity” option (see Packet 0x35), the receiver sends this packet under the following conditions:

- Each time that a fix is computed
- In response to Packet 0x37 (last known fix)

The data format is shown below.

Table A.35 Report Packet 0x56 Data Formats

Byte	Item	Type	Units
0-3	East Velocity	Single	m/s; + for east, - for west
4-7	North Velocity	Single	m/s; + for north, - for south
8-11	Up Velocity	Single	m/s; + for up, - for down
12-15	Clock Bias Rate	Single	m/s
16-19	Time-of-Fix	Single	seconds (GPS or UTC)

The time-of-fix is in GPS or UTC time as selected by the I/O “timing” option.

Report Packet 0x57 - Information About Last Computed Fix

This packet provides information concerning the time and origin of the previous position fix. The receiver sends this packet, among others, in response to Packet 0x37. The data format is shown below.

Table A.36 Report Packet 0x57 Data Formats

Byte	Item	Type	Units	Byte 0 Value/Velocity
0	Source of information	UINT8	--	00 temporary no fix 01 good current fix
1	Mfg. diagnostic	UINT8	--	
2-5	Time of last fix	Single	seconds, GPS time	
6-7	Week of last fix	INT16	weeks, GPS time	

Report Packet 0x58 - Satellite System Data/Acknowledge from Receiver

This packet provides GPS data (almanac, ephemeris, etc.). The receiver sends this packet in response to Packet 0x38 (acknowledges the loading of data). The data format is shown below.

Table A.37 Report Packet 0x58 Data Formats

Byte	Item	Type	Value	Definition
0	Operation	UINT8	1 2	Request data from receiver; Load data into receiver
1	Type of data	UINT8	2 3 4 5 6	Almanac Health page, T_oa, WN_oa Ionosphere UTC Ephemeris
2	Sat PRN#	UINT8	0 1 - 32	Data that is not satellite - ID specific satellite PRN number
3	Length (n)	UINT8		Number of bytes of data to be loaded
4 to n+3	Data			

Note – If data is not available, byte 3 is set to 0 and “no” data is sent.

The binary almanac, health page, and UTC data streams are similar to Report Packets 0x40, 0x49, and 0x4F respectively, but these reports are preferred. To get ionosphere or ephemeris, this report must be used.

Note – Ephemeris cannot be loaded into Lassen SQ GPS receiver.

Table A.38 Report Packet 0x58 Almanac Data

Byte	Item	Type	Definition / ICD-GPS-200

139-146	n	Double	derived from delta_n
147-154	r1me2	Double	$= \text{sqrt}(1.0-e^2)$
155-162	OMEGA_n	Double	derived from OMEGA_0, OMEGADOT
163-170	ODOT_n	Double	derived from OMEGADOT

Note – All angles are in radians.

Report Packet 0x5C - Satellite Tracking Status

This packet provides tracking status data for a specified satellite. Some of the information is very implementation-dependent and is provided mainly for diagnostic purposes. The receiver sends this packet in response to Packet 0x3C. The data format is shown below.

Table A.43 Report Packet 0x5C Data Format s

Byte	Bit	Item	Type	Value	Definition
0		Satellite PRN number	UINT8	number 1 - 32	
1	0-2	reserved	Bits	reserved	
1	3-5	Channel	Bits	0-7	
1	6-7	reserved	Bits	reserved	
2		Acquisition flag	UINT8	0 1 2	Never acquired Acquired Re-opened search

Table A.43 Report Packet 0x5C Data Formats (Continued)

Byte	Bit	Item	Type	Value	Definition
3		Ephemeris flag	UINT8	0 1	Flag not set Good ephemeris for this satellite (<4 hours old, good health)
4-7		Signal level	Single	Same as in Packet 0x47	
8-11		GPS time of last measurement	Single	<0 >0	No measurements have been taken. Center of the last measurement taken from this satellite.
12-15		Elevation	Singles	radians	Approximate elevation of this satellite above the horizon. Updated about every 15 sec.s. Used for searching and computing measurement correction factors.
16-19		Azimuth	Single	radians	Approximate azimuth from true north to this satellite. Updated typically about every 3 to 5 minutes. Used for computing measurement correction factors.
20-23		reserved	UINT8	0	

Report Packet 0x6D - All-In-View Satellite Selection

This packet provides a list of satellites used for position fixes by the GPS receiver. The packet also provides the PDOP, HDOP, and VDOP of that set and provides the current mode (automatic or manual, 3-D or 2-D). This packet has variable length equal to 16+nSVs where “nSVs” is the number of satellites used in the solution.

The GPS receiver sends this packet in response to Packet 0x24. The data format is shown below.

Table A.44 Report Packet 0x6D Data Formats

Byte	Bit	Item	Type	Value	Definition
0	0-2	Dimension	UINT8	3 4	2D 3D
0	3			0 1	Auto Manual
0	4-7			-	nSVs
1-4		PDOP	Single		PDOP
5-8		HDOP	Single		HDOP
9-12		VDOP	Single		VDOP
13-16		TDOP	Single		TDOP
(16+nSVvs)		SV PRN	UINT8		

Note – The Lassen SQ GPS receiver sends this packet automatically after a position fix or every second if no position fix occurs.

Command Packet 0x70 - Filter Control

Trimble OEM receivers have a number of filters. Command 0x70 provides control for these filters. It returns Report 0x70. There are three filters associated with 0x70:

- Position-Velocity (PV) Filter
- Static Filter
- Altitude Filter

The Position-Velocity (PV) Filter is the main filter and is used to “soften” the effect of constellation switches on position fixes. The filter has virtually no effect on velocity output and there is no lag due to vehicle dynamics. There may be a small increase in accuracy however.

A feature of the PV filter is the “Static Filter” which engages when the receiver is moving very slowly. This feature improves accuracy in the urban environment. The static filter should be turned off for the following applications:

- Slow-moving environments such as walking or drifting with the current
- When rooftop testing of receivers for moving applications

The altitude filter is a simple averaging filter with a time constant of a few seconds. It should be left on in marine and land applications.

To query for the current settings, use Command Packet 0x70 with no databytes. To input new settings, Command Packet 0x70 is sent with four data bytes.

Table A.45 Command Packet 70 Data Formats

Byte	Item	Type	Value	Definition
0	Position Velocity Filter	UINT8	0 1	Off On
1	Static Filter	UINT8	0 1	Off On
2	Altitude Filter	UINT8	0 1	Off On
3	Reserved	UINT8	reserved	

Report Packet 0x70

This report is sent as a response to Command Packet 0x70 as either a query or a set. It contains four bytes, as shown in Table A.46.

Command Packet 0x7A

The NMEA message determines whether or not a given NMEA message will be output. If the bit for a message is set, the message will be sent every “interval” second. Use the values shown below to determine the NMEA interval and message mask. While fixes are being generated, the output order is: ZDA, GGA, GLL, VTG, GSA, GSV, RMC.

Table A.46 Command Packet 0x7A and Report Packet 0x7B Data Formats

Byte	Bit	Item	Type	Value	Definition
0		Subcode	UINT8	0	
1		Interval	UINT8	1-255	Fix interval in seconds
2		Reserved	UINT8	0	
3		Reserved	UINT8	0	
4	0	RMC	Bit	0 1	Off On
4	1-7	Reserved	Bit	0	
5	0	GGA	Bit	0 1	Off On
5	1	GLL	Bit	0 1	Off On
5	2	VTG	Bit	0 1	Off On
5	3	GSV	Bit	0 1	Off On
5	4	GSA	Bit	0 1	Off On
5	5	ZDA	Bit	0 1	Off On
5	6-7	Reserved	Bit	0	

Report Packet 0x7B

This packet provides the NMEA settings and interval.

Report Packet 0x82 - Differential Position Fix Mode

This packet provides the differential position fix mode of the receiver. This packet contains only one data byte to specify the mode. The packet is sent in response to Packet 0x62 and whenever a satellite selection is made and the mode is Auto GPS / DGPS (modes 2 and 3). The receiver switches automatically between modes 2 and 3 based on the availability of differential corrections for a constellation which meets all other masks. If such a constellation is not available, then the receiver stays in its current automatic mode (2 or 3), and does not do position solutions.

Valid modes are:

- Mode 0 Differential off (Manual GPS) — The receiver does position solutions without differential corrections, even if the differential corrections are available.
- Mode 1 Differential on (Manual DGPS) — The receiver only does position solutions if valid differential correction data are available.
- Mode 2 Differential currently off (Auto DGPS) — The receiver is not receiving differential correction data for all satellites in constellation which meets all other masks, and is doing non-differential position solutions.
- Mode 3 Differential currently on (Auto DGPS) — The receiver is receiving differential correction data for all satellites in a constellation which meets all other masks, and is doing differential position solutions.

Note – The Lassen SQ GPS receiver sends this packet automatically after every position fix except when in Mode 0.

Report Packet 0x83 - Double-Precision XYZ Position Fix and Bias Information

This packet provides current GPS position fix in XYZ ECEF coordinates. If the I/O Position option is set to XYZ ECEF and the I/O Precision of Position option is set to Double (see Packet 0x35), the receiver sends this packet each time a fix is computed. The data format is shown below.

Table A.47 Report Packet 0x83 Data Formats

Byte	Item	Type	Units
0-7	X	Double	meters
8-15	Y	Double	meters
16-23	Z	Double	meters
24-31	clock bias	Double	meters
32-35	time-of-fix	Single	seconds

The time-of-fix is in GPS time or UTC, as selected by the I/O “timing” option.

Packet 42 provides a single-precision version of this information.

Report Packet 0x84 - Double-Precision LLA Position Fix and Bias Information

This packet provides current GPS position fix in LLA coordinates. If the I/O Position option is set to LLA and the Precision of Position option is set to Double (see Packet 0x35), the receiver sends this packet each time a fix is computed. The data format is shown below.

Table A.48 Report Packet 0x84 Data Formats

Byte	Item	Type	Units
0-7	latitude	Double	radians; + for north, - for south
8-15	longitude	Double	radians; + for east, - for west
16-23	altitude	Double	meters
24-31	clock bias	Double	meters
32-35	time-of-fix	Single	seconds

The time-of-fix is in GPS time or UTC, as selected by the I/O “timing” option.

Warning – When converting from radians to degrees, significant and readily visible errors will be introduced by use of an insufficiently precise approximation for the constant π (PI). The value of the constant PI as specified in ICD-GPS-200 is 3.1415926535898.

Packets 0x8E and 0x8F - Superpacket

See page 128 for information on Packets 0x8E and 0x8F.

Command Packet 0xBB - Navigation Configuration

In query mode, Packet 0xBB is sent with a single data byte and returns Report Packet 0xBB.

Note – This Command Packet replaces Packets 0x2C, 0x62, 0x75, and 0x77.

Table A.49 Command Packet 0xBB Query Mode Data Format

Byte #	Item	Type	Value	Definition	Default
0	Subcode	UINT8	0x00	Query mode	

TSIP Packet 0xBB is used to set GPS Processing options. The table below lists the individual fields within the 0xBB Packet. See Table A.4 for information on saving the settings to non-volatile memory.

Table A.50 Command and Report Packet 0xBB Field Descriptions

Byte #	Item	Type	Value	Definition	Default
0	Subcode	UINT8	0x00	Query mode	0x03
1	Operating Dimension	UINT8	0 3 4	Automatic (2D/3D) Horizontal (2D) Full Position (3D)	Automatic
2	DGPS Mode	UINT8	0 1 2 or 3	DGPS off DGPS only DGPS auto	DGPS auto
3	Dynamics Code	UINT8	1 2 3 4	Land Sea Air Stationary	Land
4	reserved				
5-8	Elevation Mask	Single	0.0 - 1.57 (radian)	Lowest satellite elevation for fixes	0.0873 (5°)
9-12	AMU Mask	Single	0-25 (AMU)	Minimum signal level for fixes	2.0
13-16	DOP Mask	Single	0.2-100	Maximum DOP for fixes	12.0

Table A.50 Command and Report Packet 0xBB Field Descriptions (Continued)

Byte #	Item	Type	Value	Definition	Default
17-20	DOP Switch	Single	0.2-100	Selects 2D/3D mode	5.0
21	DGPS Age Limit	UINT8	2-90 (seconds)	Maximum time to use a DGPS correction (seconds)	30
22-39	reserved				

Command Packet 0xBC - Protocol Configuration

TSIP Packet 0xBC is used to query the port characteristics. In query mode, Packet 0xBC is sent with a single data byte and returns Report Packet 0xBC. (See Table A.4 for information on saving the settings to non-volatile memory.)

TSIP Packet 0xBC is used to set the communication parameters on Port 1. The table below lists the individual fields within the Packet 0xBC and provides query field descriptions.

The BC command settings are retained in battery-backed RAM.

Table A.51 Command Packet 0xBC Port Characteristics

Byte	Bit	Item	Type	Value	Definition
0		Port to Set	UINT8	0 1 0xFF	Port 1 Port 2 Current port
1		Input Baud Rate	UINT8	2 3 4 5 6 7 8 9	reserved reserved reserved reserved 4800 baud 9600 baud 19200 baud 38400 baud
2		Output Baud Rate	UINT8	As above	As above (Note 1)

Table A.51 Command Packet 0xBC Port Characteristics (Continued)

Byte	Bit	Item	Type	Value	Definition
3		# Data Bits	UINT8	2	7 bits
				3	8 bits
4		Parity	UINT8	0	None
				1	Odd
				2	Even
5		# Stop Bits	UINT8	0	1 bit
				1	2 bits
6		Flow Control	UINT8	0	0 = none
7	0	reserved	Bit	0	
	1	TSIP input	Bit	0 1	off on
	2	reserved	Bit	0	
	3	reserved	Bit	0	
	4-7	reserved	Bit	0	
8	0	reserved	Bit	0	
	1	TSIP output	Bit	0 1	off on
	2	NMEA output	Bit	0 1	off on
	3-7	reserved	UINT8	0	
9		reserved	UINT8	0	

***Note 1** – The Lassen SQ GPS receiver requires that the input and output baud rates be identical.*

Warning – TSIP input or output must have 8 databits (byte 3).

TSIP Superpackets

Several packets have been added to the core TSIP protocol to provide additional capability for OEM receivers. In OEM Packets 0x8E and their 0x8F responses, the first data byte is a sub-code which indicates the superpacket type. For example, in Packet 0x8E-15, 15 is the sub-code that indicates the superpacket type. Therefore the ID code for OEM packets is 2 bytes long followed by the data.

Command Packet 0x8E-20 - Request Last Fix with Extra Information

This packet requests Packet 0x8F-20 or marks it for automatic output. If only the first byte (20) is sent, an 0x8F-20 report containing the last available fix will be sent immediately. If two bytes are sent, the packet is marked/unmarked for auto report according to the value of the second byte as shown in below. 0x37 can also be used for requesting 0x8F-20 if the 0x8F-20 is scheduled for auto output.

Table A.52 Command Packet 0x8E-20 Field Descriptions

Byte	Item	Type	Definition
0	Sub-packet id	UINT8	0x20
1	Mark for Auto-report (See Packet 35 byte 0 bit 5)	UINT8	0 = do not auto-report 1 = mark for auto-report

Note – Auto-report requires that superpacket output is enabled. Refer to Command Packet 35.

Report Packet 0x8F-20 - Last Fix with Extra Information (binary fixed point)

This packet provides complete information about the current position velocity fix in a compact, fixed-length 56-byte packet. The fields are fixed-point with precision matched to the receiver accuracy. It can be used for automatic position/velocity reports. The latest fix can also be requested by 0x8E-20 or 0x37 commands. The data format is shown below.

Table A.53 Report Packet 0x8F-20 Data Formats

Byte	Bit	Item	Type	Value	Definition
0		Sub-packet id	UINT8		Id for this sub-packet (always 0x20)
1		KeyByte	UINT8		Reserved for Trimble DGPS Post-processing.
2-3		east velocity	INT16		0.005 m/s or 0.020 m/s See Note 1.
4-5		north velocity	INT16		0.005 m/s or 0.020 m/s See Note 1.
6-7		up velocity	INT16		0.005 m/s or 0.020 m/s See Note 1.
8-11		Time Of Week	UINT32		GPS Time in milliseconds
12-15		Latitude	INT32	-2^{30} to 2^{30}	WGS-84 latitude, 2^{-31} semicircle (-90° - 90°)

TSIP Tool kit User's Guide

The GPS Tool Kit program disk includes several TSIP interface programs designed to help developer's evaluate and integrate the GPS module and create GPS applications. These programs run on a PC Win95, Win98, Win2000, or WinNT platform. They are intended as a base upon which to build application specific software, so the source code in ANSI C is included for many of these programs. The GPS Tool Kit program disk includes the following programs:

32 bit Windows Applications

SQ_Monitor: is a 32 bit windows application which interfaces with a TSIP-speaking receiver through a serial port. The program accepts TSIP reports and displays them in a window with fields for position, velocity, time, receiver status and satellite track status. It allows the user to exercise some basic TSIP commands. SQ_Monitor can also log TSIP report in binary format for later translation.

DOS Programs and C Source Code

TSIPCHAT.EXE: is a 16 bit DOS-based application which interfaces with the Lassen SQ GPS receiver through a serial port. It allows the user to exercise TSIP commands and may be used to view NMEA output. TSIPCHAT can log a TSIP report in binary format. Source code is provided.

TSIPPRNT.EXE: is a 16 bit DOS-based application which interprets a binary TSIP data stream, such as logged by TSIPCHAT or SQ_Monitor, and prints it to a file. Source code is provided.

For further information on the above programs, see the README file on the Toolkit disk.

A 32-bit Windows Application, TSIP Reader, is available from the FTP web site, <ftp://ftp.trimble.com/pub/set/embedded/bin>, that interprets binary TSIP data streams.

SQ_Monitor

SQ_Monitor requires Win95, Win98, Win2000, or WinNT. Once the program is started, it immediately prompts for the serial port connected to the GPS receiver.

Figure B.1 SQ_Monitor - Serial Port Selection

The main window is displayed once the GPS receiver is communicating with the application. Fields with question marks “?” indicate that information is not yet available.

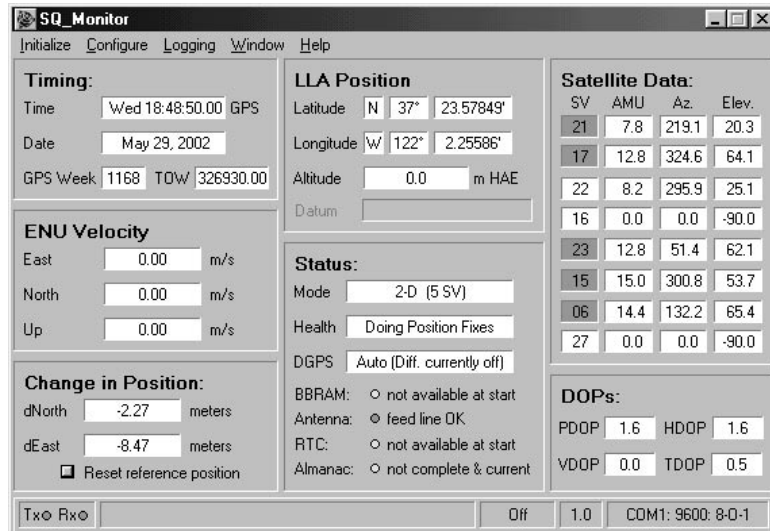

Figure B.2 SQ_Monitor - Main Window

Delta Position

SQ_Monitor displays delta position which is the difference between the current position and the initial position. The initial position can be reset at anytime by selecting [Reset Initial Position], (see).

File Storage

SQ_Monitor provides for file storage of the raw binary TSIP stream directly from the serial port. To turn data collection on or off, use the record pull-down menu. The recorded binary data stream can be translated into an ASCII file with the program TSIPRNT or TSIPReader.

NMEA 0183

This appendix provides a brief overview of the NMEA 0183 protocol, and describes both the standard and optional messages offered by the Lassen SQ GPS receiver.

NMEA 0183 is a simple, yet comprehensive ASCII protocol which defines both the communication interface and the data format. The NMEA 0183 protocol was originally established to allow marine navigation equipment to share information. Since it is a well established industry standard, NMEA 0183 has also gained popularity for use in applications other than marine electronics. The latest release of NMEA 0183 is Version 3.0 (July 1, 2000). Trimble Navigation supports both version 2.1 and version 3.0. The primary change in release 3.0 is the addition of the mode indicators in the GLL, RMC, and VTG messages.

For those applications requiring output only from the GPS receiver, NMEA 0183 is a popular choice since, in many cases, an NMEA 0183 software application code already exists. The Lassen SQ GPS receiver is available with firmware that supports a subset of the NMEA 0183 messages: GGA, GLL, GSA, GSV, RMC, VTC, and ZDA. For a nominal fee, Trimble can offer custom firmware with a different selection of messages to meet your application requirements.

For a complete copy of the NMEA 0183 standard, contact:

NMEA National Office
PO Box 3435
New Bern, NC 28564-3435
U.S.A.
Telephone: +1-919-638-2626
Fax: +1-919-638-4885

The NMEA 0183 Communication Interface

NMEA 0183 allows a single source (talker) to transmit serial data over a single twisted wire pair to one or more receivers (listeners). The table below lists the standard characteristics of the NMEA 0183 data transmissions.

Table C.1 NMEA 0183 Standard Characteristics

Signal Characteristic	NMEA Standard
Baud Rate	4800
Data Bits	8
Parity	None (Disabled)
Stop Bits	1

NMEA 0183 Message Format

The NMEA 0183 protocol covers a broad array of navigation data. This broad array of information is separated into discrete messages which convey a specific set of information. The entire protocol encompasses over 50 messages, but only a sub-set of these messages apply to a GPS receiver like the Lassen SQ GPS receiver. The NMEA message structure is described below.

\$IDMSG,D1,D2,D3,D4, ,Dn*CS [CR] [LF]

“\$”	The “\$” signifies the start of a message.
ID	The talker identification is a two letter mnemonic which describes the source of the navigation information. The GP identification signifies a GPS source.
MSG	The message identification is a three letter mnemonic which describes the message content and the number and order of the data fields.
“,”	Commas serve as delimiters for the data fields.
Dn	Each message contains multiple data fields (Dn) which are delimited by commas.
“*”	The asterisk serves as a checksum delimiter.
CS	The checksum field contains two ASCII characters which indicate the hexadecimal value of the checksum.
[CR][LF]	The carriage return [CR] and line feed [LF] combination terminate the message.

NMEA 0183 messages vary in length, but each message is limited to 79 characters or less. This length limitation excludes the “\$” and the [CR][LF]. The data field block, including delimiters, is limited to 74 characters or less.

Field Definitions

Many of the NMEA date fields are of variable length, and the user should always use the comma delineators to parse the NMEA message date field. Table C.2 specifies the definitions of all field types in the NMEA messages supported by Trimble.

Table C.2 Field Type Summary

Type	Symbol	Definition
Status	A	Single character field: A=Yes, data valid, warning flag clear V=No, data invalid, warning flag set
Special Format Fields		
Latitude	lll.lll	Fixed/variable length field: Degreesminutes.decimal-2 fixed digits of degrees, 2 fixed digits of minutes and a variable number of digits for decimal-fraction of minutes. Leading zeros always included for degrees and minutes to maintain fixed length. The decimal point and associated decimal-fraction are optional if full resolution is not required.
Longitude	yyyyy.yyy	Fixed/Variable length field: Degreesminutes.decimal-3 fixed digits of degrees, 2 fixed digits of minutes and a variable number of digits for decimal-fraction of minutes. Leading zeros always included for degrees and minutes to maintain fixed length. The decimal point and associated decimal-fraction are optional if full resolution is not required.
Time	hhmmss.ss	Fixed/Variable length field: hoursminutesseconds.decimal-2 fixed digits of minutes, 2 fixed digits of seconds and a variable number of digits for decimal-fraction of seconds. Leading zeros always included for hours, minutes, and seconds to maintain fixed length. The decimal point and associated decimal-fraction are optional if full resolution is not required.

Table C.2 Field Type Summary (Continued)

Type	Symbol	Definition
Defined		Some fields are specified to contain pre-defined constants, most often alpha characters. Such a field is indicated in this standard by the presence of one or more valid characters. Excluded from the list of allowable characters are the following that are used to indicated field types within this standard: “A”, “a”, “c”, “hh”, “hhmmss.ss”, “llll.ll”, “x”, “yyyy.yy”
Numeric Value Fields		
Variable	x.x	Variable length integer or floating numeric field. Optional leading and trailing zeros. The decimal point and associated decimal-fraction are optional if full resolution is not required (example: 73.10=73.1=073.1=73).
Fixed HEX	hh	Fixed length HEX numbers only, MSB on the left
Information Fields		
Fixed Alpha	aa	Fixed length field of upper-case or lower-case alpha characters
Fixed number	xx	Fixed length field of numeric characters

Note – Spaces are only be used in variable text fields.

Note 2 – Units of measure fields are appropriate characters from the Symbol column (see Table C.2), unless a specified unit of measure is indicated.

Note 3 – Fixed length field definitions show the actual number of characters. For example, a field defined to have a fixed length of 5 HEX characters is represented as hhhhh between delimiters in a sentence definition.

NMEA 0183 Message Options

The Lassen SQ GPS receiver can output any or all of the messages listed in Table C.3. In its default configuration (as shipped from the factory), the Lassen SQ GPS receiver outputs two messages: GGA and VTG. These messages are output at a 1 second interval with the “GP” talker ID and checksums. These messages are output at all times during operation, with or without a fix. If a different set of messages has been selected (using Packet 0x7A), and this setting has been stored in Flash memory (using Packet 0x8E-26), the default messages are permanently replaced until the receiver is returned to the factory default settings.

Note – The user can configure a custom mix of the messages listed in Table C.3. See Chapter 3, and TSIP command packets 0xBC, 0x7A, and 8E-26 in Appendix A for details on configuring NMEA output.

Warning – If too many messages are specified for output, you may need to increase the unit’s baud rate.

Table C.3 Lassen SQ GPS Receiver NMEA Messages

	Message	Description
Default Output	GGA	GPS fix data
	GLL	Geographic position - Latitude/Longitude
	GSA	GPS DOP and active satellites
	GSV	GPS satellites in view
	RMC	Recommended minimum specific GPS/Transit data
Default Output	VTG	Track made good and ground speed
	ZDA	Time & Date

The format for each message in Table C.3 is described in more detail in the next section.

NMEA 0183 Message Formats

GGA - GPS Fix Data

The GGA message includes time, position and fix related data for the GPS receiver.

```
$GPGGA,hhmmss.ss,l111.l11,a,nnnnn.nnn,b,t,uu,
v.v,w.w,M,x.x,M,y.y,zzzz*hh <CR><LF>
```

Table C.4 GGA - GPS Fix Data Message Parameters

Field #	Description
1	UTC of Position
2,3	Latitude, N (North) or S (South)
4,5	Longitude, E (East) or W (West)
6	GPS Quality Indicator: 0 = No GPS, 1 = GPS, 2 = DGPS
7	Number of Satellites in Use
8	Horizontal Dilution of Precision (HDOP)
9, 10	Antenna Altitude in Meters, M = Meters
11, 12	Geoidal Separation in Meters, M=Meters. Geoidal separation is the difference between the WGS-84 earth ellipsoid and mean-sea-level.
13	Age of Differential GPS Data. Time in seconds since the lastType 1 or 9 Update
14	Differential Reference Station ID (0000 to 1023)
hh	Checksum

GLL - Geographic Position - Latitude/Longitude

The GLL message contains the latitude and longitude of the present vessel position, the time of the position fix and the status.

```
$GPGLL,1111.111,a,yyyyy.yyy,a,hhmmss.ss,A,i*hh<CR>
<LF>
```

Table C.5 GLL - Geographic Position - Latitude / Longitude Message Parameters

Field #	Description
1,2	Latitude, N (North) or S (South)
3,4	Longitude, E (East) or W (West)
5	UTC of position
6	Status: A = Valid, V= Invalid
7	Mode Indicator A=Autonomous Mode D=Differential Mode E=Estimated (dead reckoning) Mode M=Manual Input Mode S=Simulated Mode N-Data Not Valid
hh	Checksum

GSA - GPS DOP and Active Satellites

The GSA messages indicates the GPS receiver's operating mode and lists the satellites used for navigation and the DOP values of the position solution.

```
$GPGSA, a, x, xx, xx, xx, xx, xx, xx, xx, xx, xx, xx, xx, xx,
xx, x.x, x.x, x.x*hh<CR><LF>
```

Table C.6 GSA - GPS DOP and Active Satellites Message Parameters

Field #	Description
1	Mode: M = Manual, A = Automatic. In manual mode, the receiver is forced to operate in either 2D or 3D mode. In automatic mode, the receiver is allowed to switch between 2D and 3D modes subject to the PDOP and satellite masks.
2	Current Mode: 1 = fix not available, 2 = 2D, 3 = 3D
3 to 14	PRN numbers of the satellites used in the position solution. When less than 12 satellites are used, the unused fields are null
15	Position dilution of precision (PDOP)
16	Horizontal dilution of precision (HDOP)
17	Vertical dilution of precision (VDOP)
hh	Checksum

GSV - GPS Satellites in View

The GSV message identifies the GPS satellites in view, including their PRN number, elevation, azimuth and SNR value. Each message contains data for four satellites. Second and third messages are sent when more than 4 satellites are in view. Fields #1 and #2 indicate the total number of messages being sent and the number of each message respectively.

```
$GPGSV,x,x,xx,xx,xxx,xx,xx,xx,xxx,xx,xx,xx,xxx,xx,xx,xx,xxx,xx,xx,xx,xxx,xx*hh<CR><LF>
```

Table C.7 GSV - GPS Satellites in View Message Parameters

Field #	Description
1	Total number of GSV messages
2	Message number: 1 to 3
3	Total number of satellites in view
4	Satellite PRN number
5	Satellite elevation in degrees (90° Maximum)
6	Satellite azimuth in degrees true (000 to 359)
7	Satellite SNR (C/No), null when not tracking
8,9,10,11	PRN, elevation, azimuth and SNR for second satellite
12,13,14,15	PRN, elevation, azimuth and SNR for third satellite
16,17,18,19	PRN, elevation, azimuth and SNR for fourth satellite
hh	Checksum

RMC - Recommended Minimum Specific GPS/Transit Data

The RMC message contains the time, date, position, course, and speed data provided by the GPS navigation receiver. A checksum is mandatory for this message and the transmission interval may not exceed 2 seconds. All data fields must be provided unless the data is temporarily unavailable. Null fields may be used when data is temporarily unavailable.

```
$GPRMC, hhmmss.ss,A, llll.ll, a, yyyyy.yy, a,
x.x, x.x, xxxxxx, x.x, a, i*hh<CR><LF>
```

Table C.8 RMC - Recommended Minimum Specific GPS / Transit Data Message Parameters

Field #	Description
1	UTC of Position Fix.
2	Status: A = Valid, V = navigation receiver warning
3,4	Latitude, N (North) or S (South).
5,6	Longitude, E (East) or W (West).
7	Speed over the ground (SOG) in knots
8	Track made good in degrees true.
9	Date: dd/mm/yy
10,11	Magnetic variation in degrees, E = East / W= West
12	Position System Mode Indicator; A=Autonomous, D=Differential, E=Estimated (Dead Reckoning), M=Manual Input, S=Simulation Mode, N=Data Not Valid
hh	Checksum (Mandatory for RMC)

VTG - Track Made Good and Ground Speed

The VTG message conveys the actual track made good (COG) and the speed relative to the ground (SOG).

\$GPVTG, x.x, T, x.x, M, x.x, N, x.x, K, i*hh<CR><LF>

Table C.9 VTG - Track Made Good and Ground Speed Message Parameters

Field #	Description
1	Track made good in degrees true.
2	Track made good in degrees magnetic.
3,4	Speed over the ground (SOG) in knots.
5,6	Speed over the ground (SOG) in kilometer per hour.
7	Mode Indicator: A=Autonomous Mode, D=Differential Mode, E=Estimated (dead reckoning) Mode, M=Manual Input Mode, S=Simulated Mode, N-Data Not Valid
hh	Checksum

ZDA - Time & Date

The ZDA message contains UTC, the day, the month, the year and the local time zone.

```
$GPZDA, hhmmss.ss, xx, xx, xxxx, , *hh<CR><LF>
```

Table C.10 ZDA - Time & Date Message Parameters

Field #	Description
1	UTC
2	Day (01 to 31)
3	Month (01 to 12)
4	Year
5	unused
6	unused
hh	Checksum

***Note** – Fields #5 and #6 are null fields in the Lassen SQ GPS receiver output. A GPS receiver cannot independently identify the local time zone offsets.*

Warning – If UTC offset is not available, time output will be in GPS time until the UTC offset value is collected from the GPS satellites. When the offset becomes available, the time will jump to UTC time.

***Note** – GPS time can be used as a timetag for the 1PPS. The ZDA message comes out 100-500 msec after the PPS.*

Exception Behavior

When no position fix is available, some of the data fields in the NMEA messages will be blank. A blank field has no characters between the commas. There are three general cases when no fix is available: at power-up without BBRAM (cold start); at power-up with BBRAM (warm start); and when the GPS signal is temporarily blocked. These three cases have different NMEA output behavior in the Lassen SQ GPS receiver. This section describes the behavior for the current product. The specification for this behavior may change in future products.

Power-up with No BBRAM

In this case, no previous fix is available in battery-backed memory. If the output message list and output rate has been customized (using TSIP command packet 0x7A) and stored in Flash memory, then at power-up the receiver will output the messages according to the customized setting. Otherwise, GGA messages are output every second. Before fixes are available, the message fields will be empty.

Power-up with BBRAM

In this case, a previous fix is available in battery-backed memory at power-up. If the output message list and output rate has been customized (using TSIP command packet 0x7A) and stored in Flash memory, then at power-up the receiver will output the messages according to the customized setting. Otherwise, GGA messages are output every second. Before fixes are available, the message fields will be empty except for the Time field, assuming the back-up battery power is present so that time can be tracked continuously by the RTC (Real Time Clock).

Interruption of GPS Signal

If the GPS signal is interrupted temporarily, the NMEA will continue to be output according to the user-specified message list and output rate. Position and velocity fields will be blank until the next fix, but most other fields will be filled.

Specifications and Mechanical Drawings

The Lassen SQ GPS receiver is designed for embedded industrial computing or control, mobile computing or data collection, precision timing, and vehicle tracking applications. This appendix includes the system specifications and mechanical drawings for the Lassen SQ GPS receiver module and the available GPS antennas.

Lassen SQ GPS Receiver Specifications

Performance

General	L1 frequency (1575.42 MHz), C/A code (Standard Positioning Service), 8-channel, continuous tracking receiver, 32 correlators
Update Rate	TSIP @ 1 Hz; NMEA @ 1 Hz
Accuracy	Horizontal: <6 meters (50%), <9 meters (90%) Altitude: <11 meters (50%), <18 meters (90%) Velocity: 0.06 m/sec. PPS: ± 95 nanoseconds
Acquisition	Reacquisition: <2 sec. (90%) Hot Start: <14 sec. (50%), <18 sec. (90%) Warm Start: <38 sec. (50%), <45 sec. (90%) Cold Start: <90 sec. (50%), <170 sec. (90%)
Dynamics	Acceleration: 4g (39.2 m/sec ²) Motional jerk: 20 m/sec ³

Interface

Connectors	I/O: 8-pin (2x4) male header, micro terminal strip ASP 69553.01 RF: Low-profile coaxial connector H.FL-R-SMT (10), 50 Ohm
Serial Port	1 serial port (transmit/receive)
PPS	3.3 V CMOS-compatible, TTL-level pulse Once per second with the rising edge of the pulse synchronized with UTC
Protocols	TSIP @ 9600 baud, 8 bits NMEA 0183 v3.0, selectable baud rate, 8 bits

NMEA GGA, VTG, GLL, ZDA, GSA, GSV and RMC
Messages selectable by TSIP command; selection
stored in flash memory

Electrical

Prime Power +3.0 VDC to +3.6 VDC (3.3 V typ.)
Consumption GPS board only: 100 mW@3.3V
w/ embedded antenna: 133.3 mW@3.3V
Backup Power +2.5 VDC to +3.6 VDC
Ripple Noise Max 60 mV, peak-to-peak from 1 Hz to 1 MHz

Environmental

Operating Temp. -40°C to +85°C
Storage Temp. -55°C to +105°C
Vibration 0.008 g²/Hz, 5 Hz to 20 Hz
0.05 g²/Hz, 20 Hz to 100 Hz
-3Db/OCTAVE, 100 Hz to 900 Hz
Humidity 5% to 95% R.H. non-condensing @ +60°C

Physical

Enclosure Metal enclosure with solder mounting tabs
Outside Dim. 26 mm W x 26 mm L x 6 mm H
(1.02" x 1.02" x 0.24")
Weight Approximately 5.7 grams (0.2 ounces) including
the shield

Accessories

Ultra-Compact Embedded Antenna

3.3V active miniature unpackaged antenna. Cable length: 8cm, Dim: 22 mm W x 21 mm L x 8 mm H (0.866" x 0.827" x 0.315"), Connector: HFL; mates directly to on-module RF connector.

Compact Unpackaged Antenna

3 V active micropatch unpackaged antenna. Cable length: 11cm, Dim: 34.6 mm W x 29 mm L x 9 mm H (1.362" x 1.141" x 0.354"), Connector: MCX; mates with optional RF transition cable to the on-module RF connector.

Compact Magnetic-Mount Antenna

3 V active micropatch antenna with magnetic mount. Cable length: 5m, Dim: 42mm W x 50.5mm L x 13.8mm H (1.65" x 1.99" x 0.55"), Connector: MCX; mates through the optional RF transition cable to the on-module RF connector.

Ultra Compact Embedded Antenna

Antenna

Frequency Range	1,575.42 ± 1.023MHz
Gain	90°: 3.0dBi min.; 20°: -4.0dBi min. (mounted on the 60mm X 60mm square ground plane)
Polarization	RHCP
Axial Ratio	90°: 4.0dB max.; 10°: 6.0dB max. (mounted on the 60mm X 60mm square ground plane)

LNA

Frequency range	1,575.42 ± 1.023MHz
Gain	24 3 dB (+25°C ± 5°C) 24 ± 4 dB (-40°C to 85°C)
Noise	1.5dB max. (+25°C ± 5°C) 2.0dB max. (+85°C)

Out of band rejection

f_o	1,575.42MHz
$f_o \pm 20$ MHz	7dB min.
$f_o \pm 30$ MHz	12dB min.
$f_o \pm 50$ MHz	20dB min.
$f_o \pm 100$ MHz	30dB min.

Output Impedance 50Ω

Output VSWR 2.0MAX.

Overall Specifications

Frequency Range	1,575.42±1.023MHz
Gain	27 ± 3dBi (+25°C ± 5°C) 27 ± 4dBi (-40°C TO 85°C) (mounted on the 60mm x 60mm square ground plane)
Output Impedance	50Ω
VSWR	2.0 max.
MTBF	5.13E+6Hr.

Storage Conditions

Store in room condition as listed below.

Temperature	-20°C to 45°C, humidity 80% max.
Data	Gain (at 3.0V ± 0.3V f=1575MHz) and power consumption at room temperature

General

Operating Temp.	-40°C to + 85°C
Storage Temp.	-40°C to + 100°C
Relative Humidity	20% to 95%
Input voltage	3.0V ± 0.3V
Power Cons.	5-13mA
Output connect.	HFL
Cable	0.8D 85mm: BLACK
Weight	20g TYP

Compact Magnetic Mount Antenna

Antenna

Frequency Range	1,575.42 \pm 1.023MHz
Gain	90°: 3.0dBi min.; 20°: -4.0dBi min. (mounted on the 65mm X 65mm square ground plane)
Polarization	RHCP
Axial Ratio	90°: 4.0dB max.; 10°: 6.0dB max. (mounted on the 65mm X 65mm square ground plane)

LNA

Frequency range	1,575.42 \pm 1.023MHz
Gain	28 \pm 3 dB (-40°C to 85°C)
Noise	1.5dB max. (+25°C \pm 5°C) 2.2dB max. (+85°C)

Out of band rejection

$f_0=1,575.42\text{MHz}$	
$f_0\pm 20\text{MHz}$	7dB min.
$f_0\pm 30\text{MHz}$	12dB min.
$f_0\pm 50\text{MHz}$	20dB min.
$f_0\pm 100\text{MHz}$	30dB min.

Output Impedance 50 Ω

Output VSWR 2.0max.

Overall Specifications

Frequency Range	1,575.42 ± 1.023MHz
Gain	27 ± 3dBi (+25°C ± 5°C) 27 ± 4dBi (-40°C to 85°C) (mounted on the 65mm x 65mm square ground plane)
Output Impedance	50Ω
VSWR	2.0MAX.
ESD	Antenna surface ± 15KV Connector pin ± 8KV
MTBF	5.13E+6Hr.

Storage Conditions

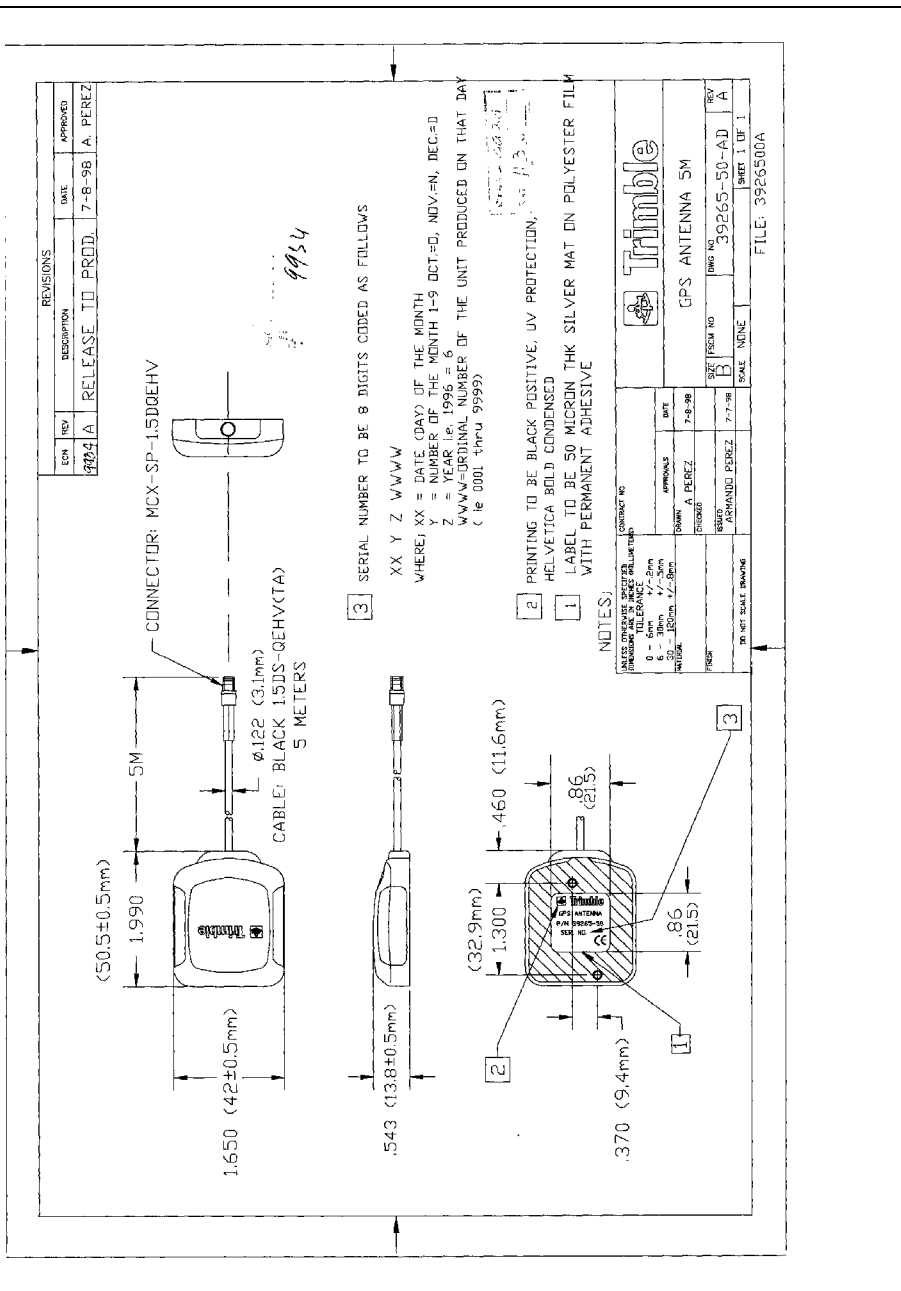

Temperature	-20°C to 45°C, humidity 80% max.
	consumption at room temperature

General

Operating Temp.	-40°C to + 85°C
Storage Temp.	-40°C to + 100°C
Relative Humidity	20% to 95%
Input voltage	3.0V ± 0.3V
Power Cons.	15mA max (room temp)
Output connect.	MCX (plug)
Cable	1.5DS-QEHV (Shikoku Cable Co.) black: 5m
Weight	20g TYP

Mechanical

Mounting	Magnetic mount
Force of magnet	3.0kgf min.
Water proof	JISD0203 S2)
Shock	50G vertical axis 30G all axis
Vibration	10~200Hz log sweep 3.0G (sweep time: 15 min.) 3 axis
Withstand	min. speed of 180Km/h
Cable pulling force	5kgf min. Visible or electrical damage must not appear when applying up to 5kgf pulling force between cable and antenna as well as between cable and connector.
Bending test	After bending test 90° right and left x 1000 cycles, no permanent damage found
Anti-corrosion	Based on JIS Z 2371, spray 5%; salt water 35°C; should not rust after 96 hours
Weight	115g ± 15g

Compact Unpackaged Antenna

The specifications for this antenna are identical to that of the Compact Magnetic Mount Antenna described earlier in this Appendix (see page 162). A drawing is provided on the following page.

Glossary

This section defines technical terms and abbreviations used in this manual. It includes terms from the field of GPS technology.

2-D GPS mode	A procedure of determining a 2-D position using signals received from the best (or only) three available GPS satellites. Altitude is assumed to be known and constant. A 2-D position solution will only be determined if signals from three or more satellites are available.
2 dRMS	Twice the distance root mean squared. The error distance within which 95% of the position solutions will fall.
3-D	Three Dimensional. A 3-D position is defined as latitude, longitude, and altitude.
2-D	Two Dimensional. A 2-D position is defined as latitude, longitude, and altitude.
3-D GPS mode	A procedure of determining a 3-D position using signals received from the best (or only) four available GPS satellites. A 3-D position solution will only be determined if signals from four or more satellites are available.
almanac	A reduced-precision subset of the ephemeris parameters. Used by the receiver to compute the elevation angle, azimuth angle, and estimated Doppler of the satellites. Each satellite broadcasts the almanac for all the satellites in the system.
ASCII	American Standard Code for Information Interchange. A standard set of 128 characters, symbols and control codes used for computer communications. ASCII characters require 7 bits of data to send, but are often sent 8 bits at a time with the extra bit being a zero.

asynchronous communication	A method of sending data in which the bits can be sent at random times. Data transmission is not synchronized to a clock. With asynchronous transmission, each character is transmitted one at a time with a “start” bit at the beginning and one or more “stop” bits at the end. Any amount of time can elapse before the next character is sent. \
auto GPS mode	A procedure of automatically determining either a 2-D or 3-D position using signals received from GPS satellites. The solution automatically transitions between 2-D and 3-D depending on the number of satellites available, the PDOP of the available satellites, and the defined PDOP switch value. (See PDOP and PDOP constellation switch).
azimuth angle	The angle of the line-of-site vector, projected on the horizontal plane, measured clockwise from true North.
bandwidth	The range of frequencies occupied by a signal. Also, the information carrying capability of a communication channel or line.
baud	A measure of the speed of data transmission. Baud and bit rate are the same for direct equipment interconnections (e.g., via RS-232). Baud and bit rate are not the same for modulated data links, whether wire or radio.
bit	Binary digit. The smallest unit of information into which digital data can be subdivided and which a computer can hold. Each bit has only two values (e.g., on/off, one/zero, true/false).
bit rate	The rate at which bits are transmitted over a communication path. Normally expressed in bits per second (bps).
byte	A set of contiguous bits that make up a discrete item of information. A byte usually consists of a series of 8 bits, and represents one character.
C/A code	The Coarse/Acquisition code. This is the civilian code made available by the Department of Defense. It is subject to selective availability (SA). Users can reduce the effects of SA by using differential GPS.

carrier	The radio signal on which information is carried. The carrier can be sensed to determine the presence of a signal.
channel	Either a single frequency or a pair of radio frequencies used as a communication path.
chip	The length of time to transmit either a zero or a one in a binary pulse code.
chip rate	Number of chips per second (e.g., C/A code = 1.023 MHz).
configuration	A set of conditions or parameters that define the structure of an item. A configuration defines the GPS processing and characteristics of the RS-232 interface ports. The term configuration can also define the hardware components that comprise a subsystem or system.
data bits	The bits in a byte of data which carry the actual information.
datum	Refers to a mathematical model of the earth. Many local datums model the earth for a small region: e.g., Tokyo datum, Alaska, NAD-27 (North America). Others, WGS-84, for example, model the whole earth.
DCE	Data Communications Equipment. The equipment that provides the functions required to establish, maintain, and terminate a communication connection. Any equipment that connects to DTE using an RS-232 or CCITT V.24 standard interface.
default setting	A preset or initial value that is assumed to be the preferred or appropriate selection for most situations. The Lassen SK II GPS sensor is shipped with factory default configuration settings; the settings were determined by Trimble Navigation.
DGPS	see <i>differential GPS</i>
DGPS reference station	A device that tracks all GPS satellites in view, periodically performs inter-channel calibrations, and calculates and transmits differential corrections.
differential capable	A term used to describe a GPS receiver that is capable of receiving and applying differential GPS corrections.

differential GPS	A procedure of correcting GPS solutions to achieve improved position accuracy. Differential GPS provides 2 to 5 meter position accuracy. Differential accuracy is obtained by applying corrections determined by the stationary Differential GPS Reference Station to the GPS data collected by the RPU unit on-board the vehicle.
differential processing	GPS measurements can be differenced between receivers, satellites, and epochs. Although many combinations are possible, the present convention for differential processing of GPS phase measurements is to take differences between receivers (single difference), then between satellites (double difference), then between measurement epochs (triple difference).
differential relative positioning	Determination of relative coordinates of two or more receivers which are simultaneously tracking the same satellites. Static differential GPS involves determining baseline vectors between pairs of receivers. Also see <i>differential GPS</i>
dilution of precision	<p>A description of the purely geometrical contribution to the uncertainty in a position fix, given by the expression $DOP = \text{SQRT TRACE}(AA)$ where AA is the design matrix for the instantaneous position solution (dependent on satellite-receiver geometry). The DOP factor depends on the parameters of the position-fix solution. Standard terms for the GPS application are:</p> <p>GDOP: Geometric (three position coordinates plus clock offset in the solution)</p> <p>PDOP: Position (three coordinates)</p> <p>HDOP: Horizontal (two horizontal coordinates)</p> <p>VDOP: Vertical (height only)</p> <p>TDOP: Time (clock offset only)</p>
DOP	see <i>dilution of precision</i> .
Doppler aiding	The use of Doppler carrier-phase measurements to smooth code-phase position measurements.

Doppler shift	The apparent change in frequency of a received signal due to the rate of change of the range between the transmitter and receiver.
earth-centered earth-fixed	Cartesian coordinate system where the X direction is the intersection of the prime meridian (Greenwich) with the equator. The vectors rotate with the earth. Z is the direction of the spin axis.
elevation angle	The angle between the line of sight vector and the horizontal plane.
elevation mask angle	A measure of the minimum elevation angle, above the horizon, above which a GPS satellite must be located before the signals from the satellite will be used to compute a GPS location solution. Satellites below the elevation angle are considered unusable. The elevation mask angle is used to prevent the GPS receiver from computing position solutions using satellites which are likely to be obscured by buildings or mountains.
ellipsoid	In geodesy, unless otherwise specified, a mathematical figure formed by revolving an ellipse about its minor axis. It is often used interchangeably with spheroid. Two quantities define an ellipsoid; these are usually given as the length of the semimajor axis, a , and the flattening, $f = (a - b)/a$, where b is the length of the semiminor axis.
ephemeris	A set of parameters that describe the satellite orbit very accurately. It is used by the receiver to compute the position of the satellite. This information is broadcast by the satellites.
epoch	Measurement interval or data frequency, as in making observations every 15 seconds. Loading data using 30-second epochs means loading every other measurement.
firmware	A set of software computer/processor instructions that are permanently or semi-permanently resident in read-only memory.

frequency	<p>The number of vibrations per second of an audio or radio signal. Measured in hertz (Hz), kilohertz (kHz), or megahertz (MHz).</p> <p>GPS frequencies are: L1 = 1575.42 MHz L2 = 1227.60 MHz</p>
GDOP	<p>Geometric Dilution of Precision. GDOP describes how much an uncertainty in pseudo-range and time affects the uncertainty in a position solution. GDOP depends on where the satellites are relative to the GPS receiver and on GPS clock offsets.</p>
geodetic datum	<p>A mathematical model designed to best fit part or all of the geoid. It is defined by an ellipsoid and the relationship between the ellipsoid and a point on the topographic surface established as the origin of datum. This relationship can be defined by six quantities, generally (but not necessarily) the geodetic latitude, longitude, and the height of the origin, the two components of the deflection of the vertical at the origin, and the geodetic azimuth of a line from the origin to some other point. The GPS uses WGS-84.</p>
geoid	<p>The actual physical shape of the earth which is hard to describe mathematically because of the local surface irregularities and sea-land variations. In geodetic terms it is the particular equipotential surface which coincides with mean sea level, and which may be imagined to extend through the continents. This surface is everywhere perpendicular to the force of gravity.</p>
GPD	<p>GPS with differential corrections applied.</p>

GPS	Global Positioning System. A constellation of 24 radio navigation (not communication) satellites which transmit signals used (by GPS receivers) to determine precise location (position, velocity, and time) solutions. GPS signals are available world-wide, 24 hours a day, in all weather conditions. This system also includes 5 monitor ground stations, 1 master control ground station, and 3 upload ground stations.
GPS antenna	An antenna designed to receive GPS radio navigation signals.
GPS processor	An electronic device that interprets the GPS radio navigation signals (received by a GPS antenna) and determines a location solution. The GPS processor may also be able to apply (and determine) differential GPS corrections.
GPS receiver	The combination of a GPS antenna and a GPS processor.
GPS time	The length of the second is fixed and is determined by primary atomic frequency standards. Leap-seconds are not used, as they are in UTC. Therefore, GPS time and UTC differ by a variable whole number of seconds.
HDOP	Horizontal Dilution of Precision.
HOW	Handover word. The word in the GPS message that contains time synchronization information for the transfer from C/A to P-code.
interface cable (serial)	The interface cable allows data to flow between the Lassen SK II GPS and the communication equipment. One end of the cable has a 9-pin female RS-232 connector and the other end of this cable has a 9-pin male RS-232 connectors.
interference	Refers to the unwanted occurrences on communication channels that are a result of natural or man-made noises and signals, not properly a part of the signals being transmitted or received.
integrated Doppler	A measurement of Doppler shift frequency or phase over time.

IODE	Issue Of Data, Ephemeris. Part of the navigation data. It is the issue number of the ephemeris information. A new ephemeris is available usually on the hour. Especially important for Differential GPS operation that the IODE change is tracked at both the reference station and mobile stations.
jamming	Interference (in either transmitting or receiving signals) caused by other radio signals at exactly or approximately the same frequency
Kalman filter	A numerical method used to track a time-varying signal in the presence of noise. If the signal can be characterized by some number of parameters that vary slowly with time, then Kalman filtering can be used to tell how incoming raw measurements should be processed to best estimate those parameters as a function of time.
masks	See <i>satellite masks</i> .
maximum PDOP	A measure of the maximum Position Dilution of Precision (PDOP) that is acceptable in order for the GPS processor to determine a location solution (see PDOP).
NAVSTAR	The name given to the GPS satellites, built by Rockwell International, which is an acronym formed from NAVigation System with Time And Ranging.
NMEA	National Marine Electronics Association. An association that defines marine electronic interface standards for the purpose of serving the public interest.
NMEA 0183 message	NMEA 0183 is a standard for interfacing marine electronics navigational devices. The standard specifies the message format used to communicate with marine devices/components.
packet	An “envelope” for data, which contains addresses and error checking information as well as the data itself.
parity	A scheme for detecting certain errors in data transmission. Parity defines the condition (i.e., even or odd) of the number of items in a set (e.g., bits in a byte).

PDOP	Position Dilution of Precision. PDOP is a unitless figure of merit that describes how an uncertainty in pseudo-range affects position solutions.
PDOP constellation switch	A value, based on PDOP, that defines when the GPS receiver/processor should switch between 2-D and 3-D GPS modes. The PDOP constellation switch is only active when the GPS mode of operation is set to Auto.
PRN	Pseudo-random noise. Each GPS satellite generates its own distinctive PRN code, which is modulated onto each carrier. The PRN code serves as identification of the satellite, as a timing signal, and as a subcarrier for the navigation data.
protocol	A formal set of rules that describe a method of communication. The protocol governs the format and control of inputs and outputs.
pseudo-range	A measure of the range from the GPS antenna to a GPS satellite. Pseudo-range is obtained by multiplying the speed of light by the apparent transit time of the signal from the GPS satellite. Pseudo-range differs from actual range because the satellite and user clocks are offset from GPS time and because of propagation delays and other errors.
RAM	Random-Access Memory.
random-access memory	Memory in which information can be referred to in an arbitrary or random order. The contents of RAM are lost when the System Unit is turned off.
range	A term used to refer to the distance radio signals can travel before they must be received or repeated due to loss of signal strength, the curvature of the earth and the noise introduced because of moisture in the air surrounding the earth's surface.
range rate	The rate of change of range between the satellite and receiver. The range to a satellite changes due to satellite and observer motions. Range rate is determined by measuring the Doppler shift of the satellite beacon carrier.

read-only memory	Memory whose contents can be read, but not changed. Information is placed into ROM only once. The contents of ROM are not erased when the system unit's power is turned off.
real time clock	An electronic clock, usually battery powered, that keeps current time. Used by a GPS receiver during a warm or hot start to determine where to search for GPS satellite signals.
relative positioning	The process of determining the vector distance between two points and the coordinates of one spot relative to another. This technique yields GPS positions with greater precision than a single point positioning mode can.
rise/set time	Refers to the period during which a satellite is visible; i.e., has an elevation angle that is above the elevation mask. A satellite is said to “rise” when its elevation angle exceeds the mask and “set” when the elevation drops below the mask.
ROM	Read-Only Memory.
RS-232	A communication standard for digital data. Specifies a number of signal and control lines. RS-232 is often associated with a 25 pin connector called a DB-25.
RTCM	Radio Technical Commission for Maritime Services. Commission that recommends standards for differential GPS services. “RTCM Recommended Standards For Differential GPS Service,” prepared by RTCM Special Committee No. 104 (RTCM SC-104), defines a communication protocol for sending GPS differential corrections from a differential reference station to remote GPS receivers.
satellite masks	As satellites approach the horizon, their signals can become weak and distorted, preventing the receiver from gathering accurate data. Satellite masks enable you to establish criteria for using satellite data in a position solution. There are three types of satellite masks: Elevation, SNR, and PDOP.

SA	Selective Availability. This is the name of the policy and the implementation scheme by which unauthorized users of GPS will have their accuracy limited to 100 meters 2D RMS horizontal and 156 meters 2D RMS vertical.
SEP	Spherical Error Probability. The radius of a sphere such that 50% of the position estimates will fall within the surface of the sphere.
serial communication	A system of sending bits of data on a single channel one after the other, rather than simultaneously.
serial port	A port in which each bit of information is brought in/out on a single channel. Serial ports are designed for devices that receive data one bit at a time.
signal to noise level	GPS signals with SNRs that do not meet the mask criteria are considered unusable.
signal to noise ratio	A measure of the relative power levels of a communication signal and noise on a data line. SNR is expressed in decibels (dB).
SNR	Signal to Noise Ratio.
spread spectrum	The received GPS signal is a wide bandwidth, low-power signal (-160dBW). This property results from modulating the L-band signal with a PRN code in order to spread the signal energy over a bandwidth which is much greater than the signal information bandwidth. This is done to provide the ability to receive all satellites unambiguously and to provide some resistance to noise and multipath.
SPS	Standard Positioning Service. Refers to the GPS as available to the authorized user.
start bit	In asynchronous transmission, the start bit is appended to the beginning of a character so that the bit sync and character sync can occur at the receiver equipment.
stop bit	In asynchronous transmission, the stop bit is appended to the end of each character. It sets the receiving hardware to a condition where it looks for the start bit of a new character.

SV	Space Vehicle (GPS satellite).
synchronous communication	A method of sending digital data in which the bits come at fixed, rather than random, times and are synchronized to a clock.
TAIP	Trimble ASCII Interface Protocol. Designed originally for vehicle tracking applications, TAIP uses printable uppercase ASCII characters in 16 message types for easy integration with mobile data modems, terminals, and personal computers. The TAIP protocol is defined in full in Appendix C.
TANS	<p>Trimble Advanced Navigation Sensor. Also refers to a Trimble-specified interface protocol for digital packet communication to/from the GPS receiver. Data output includes time-tagged position and velocity, satellite status, dilution of precision factors and diagnostics of GPS receiver operational status.</p> <p>Also see <i>TSIP</i></p>
TNL 4000RL	Trimble Navigation, Ltd. Reference Locator (4000RL). Product name for the Differential GPS Reference Station.
TSIP	Trimble Standard Interface Protocol. A binary/hex packet bi-directional protocol, also known as the TANS protocol. Used by a large number of Trimble sensors. TSIP is the subset of TANS which is recognized by all Trimble sensors except the 4000 series. The TSIP protocol is defined in full in Appendix A.

URA	Satellite user range accuracy. The URA is sent by the satellite and is computed by the GPS operators. It is a statistical indicator of the contribution of the apparent clock and ephemeris prediction accuracies to the ranging accuracies obtainable with a specific satellite based on historical data.
UTC	Universal Time Coordinated. Uniform atomic time system/standard that is maintained by the US Naval Observatory. UTC defines the local solar mean time at the Greenwich Meridian.
UTC offset	The difference between local time and UTC (Example: UTC - EST = 5 hours).
